- Support for mouse, digital and analogue; simplified car control method using digital.  
- Instant Replay, to see your favourite car passing, crash, tail-head, etc.  
- 6 different camera views, featuring the VirtualCockpit system: inside car, just behind, far-behind, 360 degrees, track camera. Possibility to see every different car with every camera view.  
- Full multitasking.  
Amiga with CD Minimum: 8mb, 030 + HD  
Order: CD626D £20.00

# VIRTUAL GP

**THE PROPHET**  
The Prophet is the next generation in R.P.G. It features over 200,000 locations with over 50 different types of location. There is no fixed route through the game.  
Discover plots within plots, help the poor or just kill for money and power. Quests that change the shape of the game-completing one may open or close another. A unique learning system. A full graphical display of your character showing the different armour worn and weapons held. There's dozens of different items. Keys, food, potions and spells. Loads of fantastic monsters to face. This game really is what all you RPG addicts have been waiting for.  
Amiga with CD-ROM Minimum: 4mb + HD  
Order: CD860D £20.00

# SIM CITY 2000

SimCity 2000 is back. If you thought the original was addictive, prepare for a 3D metropolis that even Aliens find out of this World. After terraforming your own landscape, you'll discover new features like subways, schools, marines and parks. Meanwhile, beneath the city's teeming surface, a complete underground network awaits connection. While you view your brainchild from multiple angles in stunning 3D, the local newspaper will be viewing your actions with a decidedly cynical eye, reporting your every move. Optimised for better Processors.  
Will you prove a wise leader or will absolute power corrupt you?  
AGA Amiga (Supplied on Disk) Minimum: 4mb, HD  
Sim City 2000 oem £9.99

# Month in View

Chairman Vost presides over his adoring masses once more...

**WORLD OF AMIGA SHOW REPORT**  
As you might imagine - a lot went on at this year's World of Amiga show in Kensington.

14

All hail the Amiga public! We have all come here in this four week period to celebrate the fact that your glorious leader ascended to godhood with the AAA award this issue. He truly is... oh hang on a mo, I can't do this. It was very nice, and a great surprise to me winning this AAA award, but it's kind of irrelevant when it comes to producing the magazine. Sure, it's nice now to have a set of Nubian slaves waiting on my every whim, but like the lottery millionaires, I won't let it change my life.

Ben Vost  
Editor

It wasn't even the best thing for me at the show. The best thing is always (and has always been) talking to people, not just the dealers and developers, but also the users (and especially their girlfriends) and all the people that actually make the show happen. This year was especially groovy since I got to speak to usergroups and their members, and put a few faces to the names on the afb.

The other big news is that because of changes to the mag that mean you'll get an extra seven pages of class editorial content, this is the last Month in View page we'll have. To make sure you get as much info as possible out of every issue of AF, we're getting rid of some of the regular pages in the magazine to enable us to put more good stuff in. The issue size isn't increasing, unfortunately, but the number of pages of reviews, features and tutorials is.

That aside, we've got a cracking issue for you this time, with a huge guide to the World of Amiga show (and accompanying MPEG audio on the CD). A couple of the reviews we had planned for this ish have had to be held back (like *Tornado 3D* - again), but even so there should be enough to satisfy the biggest hunger.

Lastly, we've responded to the many requests we get for tutorials for the complete beginner. We hope that these four page one-offs will help people who are struggling to get to grips with all things Amiga, but please give us some feedback on how they can be improved. Th-th-that's all folks!

AF

### NEW GAMES

The Amiga games scene is definitely on the rise. We review three games this issue, with more to follow!

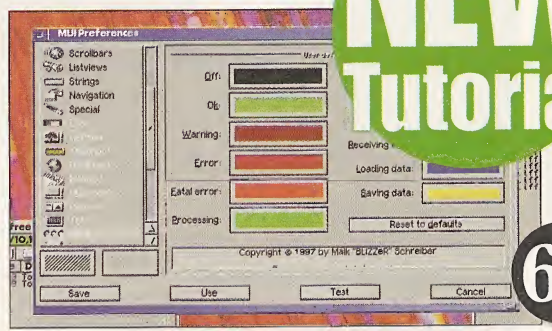

28

### BEGINNERS GUIDE TO...THE AFCD

Get to grips with our CD and make it work for you as nicely as it does for us!

### 44 BROWSER PREVIEW

Typical isn't it? You wait ages waiting for a browser, then two come along at once. It's the AFB site. But is it better using *iBrowse* or *Voyager*?

### 46 HYPERCOM CARDS

Add speedy parallel and serial ports to your big box Amiga.

Little black cards. But what do they do?

### 48 EXTREME

A full review of this new video effects generator.

You can create all sorts of far-out animations with *Extreme*.

### 49 POWER CD-ROM

Ben Vost explains why this 8 speed CD-ROM represents good value for money.

Slim and slick. What's more, it works a treat.

### 50 IMAGEFX 4 W.I.P.

This final section in our sneak preview demonstrates some of *ImageFX 4's* capabilities.

Snazzy effects abound. Kermit shows you how.

### 52 HEAD 2 HEAD - BASICS

BASIC - an old favourite programming language, but which is the best for the Amiga?

AmigaBasic: The original, but not necessarily the best.

**AF COVER STORY**

**p 14**

Did Amiga give us the low-down on the NG machines? Did usergroups lower the tone? What was on sale? Is Jim Collas the new messiah? How long is a piece of string? Find out the answers to all these questions in our huge feature on WoA. Apart from the one about the string. The answer is twice as long as half its length, by the way.

Look at all these great games. Screenplay is positively bursting at the seams for this issue.

**AF CD-ROMS**

**84 AFCD44**  
Find out what goodies we've managed to pack onto the AFCD this month.

**AF COVERDISKS**

**80 NEWICONS 4.6**  
Jazz up your WB with this nifty little program.

**ASTROKID**  
Arcade-style fun with this cheeky little chappy.

**AF SCREENPLAY**

**PREVIEWS 26**

Find out what games are on their way.

**T-ZERO 28**

Shoot everything in this splendid blaster.

**WASTED DREAMS 30**

Get involved with *Wasted Dreams'* plot

**SUPERFROG 32**

He's green and not very mean. Cute, really.

**GAMEBUSTERS 34**

Now you can complete *Sixth Sense*

**WHAT'S UP?**

MCC details emerge  
Find out what Amiga's first machine to be released will consist of.

New office suite  
Epic Marketing announce *Platinum Suite 2000*

phase5 and QNX deal  
QNX for classic Amiga?

# WORLD NEWS

## MCC details emerge

Amiga have released a so-called Technology Brief detailing the new Amiga Operating Environment (AmigaOE) and specifications for the first next generation Amiga computer.

This Technology Brief states the Amiga vision and mission: 'to make computers and the Internet a natural part of everyday life'. It continues, 'we are defining a new distributed home computing environment that enables a user experience that is much more accessible than today's personal computer experience.' A bold aim, indeed.

Amiga show and got a decidedly mixed reaction from show attendees. The design opted for consists of a VCR-sized

equipment, rather than the traditional cream or beige.

As you can see from the specifications (see boxout), the CPU that will power the new MCC has not yet been revealed. Possible contenders are MIPS, PowerPC, Transmeta and Sun's new MAJC. Of these, PowerPC is

The new Amiga MCC will look right at home sitting next to your hifi or video recorder. perhaps the least likely due to its expensive silicon. The smart money is on Transmeta's secret superchip, but Sun's new chip looks interesting too. The problem with relying on the

“ The first new Amiga device will be called the Amiga Multimedia Convergence Computer or MCC ”

base unit and a matching 15" monitor. The colour of the device again points at the target audience for this machine: black will be more at home in the living room with existing audio and video

### THE MCC

The first new Amiga device will be called the Amiga Multimedia Convergence Computer or MCC. The more alert readers will note that MCC is equal to 1200 in Roman numerals, which may give you some sort of guide as to the target market for this machine. The MCC will ship in two forms: as an integrated box and as an ATX form factor motherboard. This latter will be available for users and OEMs to house in industry standard cases and provide custom solutions for which the former is too restrictive.

In issue 126 of *AF* we published a number of Pentagram's sketches of possible AmigaNG case designs. However, the design that Amiga have selected for the integrated system is none of these. A mock-up of this case was on display at this year's World of

## WHO OR WHAT IS TRANSMETA?

Transmeta are a Silicon Valley startup veiled in secrecy. Thanks to a carefully constructed shroud of mystery surrounding the company, surprisingly few facts are known about them. When queried as to what they are up to the response is an inevitable 'cool stuff with computers'.

Transmeta was founded by David Ditzel, an ex-employee of Sun Microsystems and one of the designers of the SPARC, an early RISC processor. Transmeta was partly funded by Paul Allen, the co-founder of Microsoft. Until recently, Transmeta was listed on his website as a creator of VLSI engines. Not very helpful. Among Transmeta's list of highly talented employees is Linus Torvalds, geek god and creator of the Linux operating system.

Rumours, the enigmatic patents that Transmeta have filed, and some leaps of logic lead to the conclusion that Transmeta are working on a VLIW (Very Long Instruction Word) processor. This is not

in itself revolutionary: other VLIW projects exist, such as Intel's IA-64 and the Russian Elbrus. What is interesting about Transmeta is that they are apparently working on some kind of code-morphing technology. The Transmeta chip can dynamically change its instruction set. The upshot is that their CPU should be able to execute x86 instructions and Java bytecode with equal facility. Because of the simplicity of its VLIW design, this chip should require a quarter the silicon of a Pentium II and should thus be a very low cost solution.

Transmeta has long been rumoured as a possible technology for a next generation Amiga. Amiga themselves are being particularly coy, hinting at Transmeta as a hardware partner, but not actually admitting anything explicitly. If there is a connection between Transmeta and Amiga, you can bet that Amiga won't be allowed to announce anything until Transmeta are good and ready.

# Talking heads

## What have the Amiga Format staff been doing this month?

**Ben Vost**  
Editor

A busy issue indeed. Not only did we have the show to contend with, but all sorts of other stuff

too. Book of the year so far: *The Surgeon of Crowthorne*, by Simon Winchester. Absolutely brilliant!

**Richard Drummond**  
Staff Writer

Busy? That Vost chap doesn't know the meaning of the word. Ill health,

moving house (again), the show and I still found time to count the grains of sand on Weston beach.

**Paul Cavahagh**  
Prod. Editor

I've been hanging out with hippies and druids in some of Wiltshire's

finest stone circles. And trying to make a good impression with my first issue of *AF* of course.

**Colin Nightingale**  
Art Editor

I've been up to no good again, meddling with the occult and conjuring up spirits which if

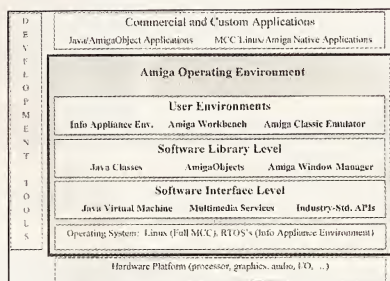

my incantations are correct you will witness as your sun being devoured by my demons on 11th August

Transmeta chip – as far as the industry is concerned – is that it is an unknown and untested factor. There's also the question of whether Transmeta will actually be able to deliver silicon in time for Amiga's target.

### AMIGA OE AND AMIGAOBJECTS

The other aspect of the Technology brief discussed the new Amiga Operating Environment and the previously-hinted-at AmigaObjects.

As most readers will be aware from last month's shock announcement, the AmigaOE will run on top of a Linux kernel – that is, at least in the Amiga MCC. The Linux decision lends support to the notion that Transmeta will be providing the processor for the MCC. Transmeta are rumoured to be working

The Amiga OE will support two classes of application.

on a special Linux kernel, highly optimised for their chip. Correspondingly, the Tech. Brief talks of 'binding the OS kernel to a specialized, high-performance hardware

architecture that resolves many of the concerns... with existing Linux implementations'.

As we revealed previously, the Amiga OE will support two classes of application. Class one applications will be built from AmigaObjects, a powerful platform and network independent technology constructed with Java. These will work on any Amiga-enabled

information appliance. Class two applications will be native Amiga MCC applications. The OE will support both classes with industry-standard APIs such as *OpenGL*.

The Amiga OE will use the *X Window* system to provide the graphical interface. A new Workbench-style desktop and window manager will be developed. A lower footprint windowing system will be provided for smaller appliances.

No, it's not an iMac, it's the Amiga MCC.

# Amiga MCC Specification

## PROCESSING SUBSYSTEMS

- High performance next generation CPU
- Hardware assist for Linux kernel, Java VM, and classic Amiga emulation.
- 168-pin SDRAM DIMMs (future support for DDR SDRAM).
- 32MB system RAM expandable to 288MB (ATX goal to be expandable to 1GB).

## GRAPHICS SUBSYSTEM

- Advanced superscalar rendering 2D and 3D hardware accelerator (unannounced next-generation ATI chipset – specs still under non-disclosure).
- 24-bit true colour depth supporting 640x480 to 1920x1200 resolutions
- Texture lighting and compositing, alpha blending, vertex- and table-based fog, video textures, reflections, shadows, spotlighting, bump mapping, LOD biasing, texture morphing, hidden surface Z-buffering, dithering, anti-aliasing, gouraud- and specular-shaded polygons, perspective correct mip-mapping texturing, chroma-key, bilinear and trilinear texture filtering. Additional features to be announced when ATI release next generation information.

- 32MB 128-bit SDRAM frame buffer

## AUDIO/VIDEO

- DVD Drive standard (DVD-RAM when available).
- DVD playback including:
  - MPEG-2 hardware decode acceleration, motion compensation and iDCT.
  - Hardware sub-picture decoder with interpolating scalar and alpha compositor.
- Realtime video compression with MPEG-2.
- Still image capture acceleration.
- Analog TV: NTSC/PAL/Secam input, digitisation and TV outputs.
- S-Video and composite video I/O.
- Full channel TV tuner.
- 44kHz, 16-bit CD stereo audio I/O.
- AC-3 Dolby Digital 5:1 channel decode.
- S/PDIF Dolby Digital output.
- FM radio tuner under consideration.

## COMMUNICATION OPTIONS (IN DEVELOPMENT)

- V.90 56Kb/s modem.
- 10/100Mb/s ethernet.
- HomePNA 2.0 10Mb/s home networking.

- Broadband Internet options:
  - 1.5MB/s cable modem
  - DSL modem
  - ISDN modem
  - Digital satellite decoders

## MASS STORAGE

- Two E-IDE UltraDMA interfaces (support for four drives).
- Support two high capacity hard drives (ATX user configurations could support more).

## INTERNAL EXPANSION

- 2 PCI slots (ATX target is 6 PCI slots).
- 3.5" open bay for Zip/Jazz/120MB floppy or other options.

## I/O

- Infrared remote control devices.
- Microphone input.
- Display touch screen controller.
- 7 Universal Serial Bus (USB) 10Mb/s digital ports (2 in front for easy access).
- IEEE1394 (Firewire) option under investigation.

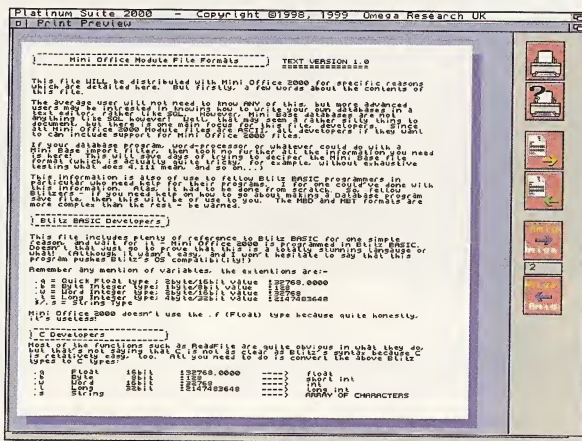

Continued overleaf →

# New office suite

**E**pic Marketing have joined forces with Omega Research to bring out a new integrated office suite, called *Platinum Suite 2000*, this autumn. It contains six modules which include the usual word processor, database and spreadsheet, but also an organiser, calculator and simple DTP package. All the modules are designed to share their data with each other, which should make for a highly productive environment, and the authors say that, "Each module has ease of use and speed as its main emphasis at its core. Also, features which are not normally connected to a product of *Platinum Suite 2000's* price".

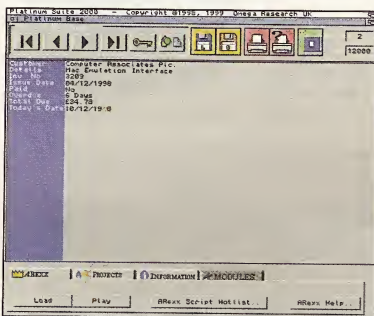

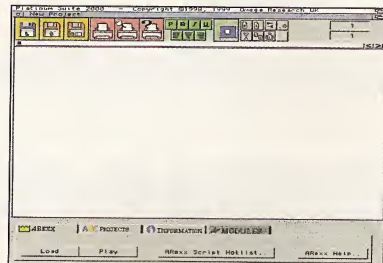

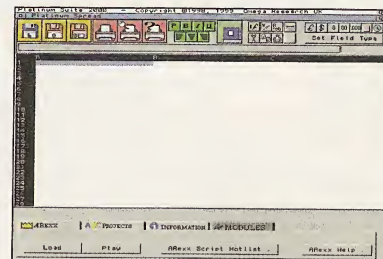

Compatibility with other platforms and other Amiga packages is to be provided along with *PS2k's* custom formats. The suite also apparently offers features not previously seen in Amiga software packages before now.

As yet, the price has not been set in stone, and the suite is still in development, but Epic are expecting to be able to start selling *Platinum Suite*,

**Platinum Suite 2000, will this be the integrated office suite that everyone will want?**

2000 by the middle of October. It will need an 030, 16MB RAM, CD-ROM and hard drive. For more details, contact Epic Marketing on (0500) 131486.

Platinum Suite's database module.

## HIGH FIVE FOR RC5 TEAM

**T**he Amiga RC5 Team effort has overtaken the Japanese Linux team in the Distributed.Net/RC5-64 challenge and is now ranked fifth overall out of over 7000 teams (consisting of an estimated 180,000 participants). The race for the fourth position is now underway, and we are gaining as fast on the Japanese FreeBSD team as we did on the Linux team.

The Amiga RC5 Team effort focuses on bringing exposure to the Amiga and the community spirit and strives to achieve this by ranking high in distributed computing projects such as the RC5 and DES challenges, using otherwise idle computing power only.

Almost 2000 individuals with about 3500 machines (over half of which are Amigas) are participating in the Amiga team now, and our

growth continues. The number of PowerPC-equipped Amigas now stands at 580 (or about 30% of all Amigas). There is still plenty of time to participate, as the current search for the RC5-64 key stands at 10.5% of the keyspace.

Everyone is welcome to join, with any kind of machine, though at least one Amiga is appreciated. For a full explanation of what the effort is about, where it's heading, how to participate and everything from statistics to member listings, visit the Amiga RC5 Team effort homepage at <http://distributed.amiga.org>.

The Amiga RC5 Team effort is also providing a mailing list as a forum for the discussion of the above topics and the effort in general, and recently Amiga themselves have pledged support.

## 100 Issues ago

# AMIGA FORMAT

We look at what was going on in the Amiga market 100 issues of AF ago...

- Cover feature: Want to know a secret? Graphics for games discussed with game creators like Mev Dinc and others. There's also a feature with a real rally driver and a pilot discussing the realism of some of the driving games and flight sims then available for the Amiga.
- On the disks: Demo of First Samurai and MiG-29, and a load of PD on the single disk.
- News: The closure of the CES in London by EMAP means that Future's World of Commodore show is the biggest in the UK, plenty of new products are announced: Scenery Animator, GB Route 2, Aegis Visionary, SuperJAM! and the first mention in AF of Directory Opus.
- Prices: Prices for software haven't changed much over the years, becoming cheaper if anything. A title like GB Route 2 would have

## AF28 November 1991

set you back £80 in 1991 and Interspread, a poor spreadsheet compared to TurboCalc 5 now, would have cost you £49.95.

■ Games reviewed included: Utopia (Gremlin) 84%, Head over Heels (Hit Squad re-release) 79%, Silent Service II (Microprose) 82%, Midwinter 2 (Rainbird) 87%, Final Fight (US Gold) 60%

■ Serious products reviewed: Scala (SDL) 86%, ShowMaker (Gold Disk) 92%, ProText 5.5 (Arnor) 90%, Distant Suns (VRLI) 84%

■ Notes: We're still not bad value for money when you consider that three quid was worth more then, and we now supply a CD full of material compared to the single floppy we used to do. Oh yes, and there are now proper scores for serious products too.

■ Pages: 244      ■ Cost: £2.95

# phase 5 and QNX team up

Following the surprise announcement that QNX is no longer to be used as the kernel of the next generation Amiga operating system, a surprise deal was announced between phase 5 and QNX Software Systems.

The deal gives phase 5 a licence to port the QNX Neutrino OS to its current range of PowerPC accelerators for the classic Amiga. This port will be made freely available to all existing owners of PowerUP boards. QNX benefit by gaining a hardware partner and existing user base capable of running a desktop version of its OS.

phase 5 have also revealed plans for a next generation multimedia computer known as the AmiRage K2 which will ship with the QNX Neutrino operating system and legacy compatibility for AmigaOS 3.x. The K2 will be a multiprocessor system, supporting up to four G4 processors, and will feature up to 2GB

of SDRAM, PCI slots and some unspecified 'leading edge 3D processor'. Coincidentally, the audio, video and I/O capabilities of the K2 seems remarkably similar to the specifications of the Amiga MCC.

The K2 is scheduled for release at the beginning of 2000. Given phase 5's track record on PPC-box announcements, though, few Amiga users will be holding their breath. phase5 say, 'We are excited that we finally can create a product technology which we could not realize in the past, due to the lack of OS support... the QNX Neutrino OS concept is also in full accordance with our vision of a new OS... we feel that we can finally make the dream of many Amiga users as well as other computer users come true'. A price for the AmiRage K2 is yet to be announced.

phase 5 and QNX. A peculiar partnership or a force to reckon with? Only time will tell.

## Vital Horgan

With a CPU, operating environment and technical specs virtually all in place for the NG Amiga, it's time that attention was turned to the crucial matter of software. It's no great revelation to suggest a new system needs a killer app to get off to a good start, but what should that be? I've got a couple of ideas. The first one is inspired by the animation processing system, Wildfire. It's not killer app material right now, but with the right hardware at its disposal and some re-development for the professional sector, I'm sure it could do the business. Imagine an all-in-one desktop video system with the ability to combine at least two live broadcast quality video streams, process them in realtime with a range of software-based (and hence infinitely-expandable) effects, with both broadcast and monitor outputs. With software written to take advantage of the power and flexibility of the Transmeta chip (or whatever it is they end up using), such a system could wipe the floor with the competition, in terms of value for money, efficiency, upgradability and versatility. I'm not talking about "Bill's Wedding Video Services" here either. With the right connections and interfaces to professional TV and video gear, this could become a mainstay of TV studios the world over. While that in itself wouldn't amount to a whole lot of unit sales, the machine's awesome reputation would soon spread, and it wouldn't take long before interactive entertainment developers realised its potential for all kinds of next generation techno fun. And before I go, while we're on the subject, Amiga, please make some approaches to the major players in original, high quality video game development. Co-fund the development of a game that will be available exclusively (for a time at least) on the NG Amiga. The reason you'll need to co-fund it is to lessen the financial risk on their part, allowing them to give the project their full creative talents. Tell them you want to invent a whole new game genre. If they balk at the suggestion, you'll know you've asked the wrong people.

Tony Horgan

# AAA winners

Although it's true that I, Ben Vost, won the UK award from the AAA, the international award is by far the more prestigious, with a custom-designed crystal Boing Ball going to the winner. This year, the nominees were Marcel Beck; Haage & Partner; and phase 5 and Haage & Partner; and perhaps unsurprisingly Marcel won. Unfortunately, neither he, nor Wolf Dietrich, who was going to represent phase 5, could make it. Jurgen Haage, who was accepting Haage &

Well done to Marcel Beck, who walks off with a very nice glass Boing Ball and some deserved recognition.

Partner's nomination, and also phase 5's on behalf of Wolf, looked a little forlorn standing on the stage on his own, but lead the clapping when Marcel Beck was announced as the winner by Petro Tyschtschenko.

The AAA awards committee gave the following as the reason why Marcel Beck was given the award: "For his creation of and continuing devotion to YAM, Yet Another Mailer. Its many features, ease of use, stylish GUI and stability make it an unparalleled e-mail client, which also is completely free!"

Although Marcel Beck could not attend the show, the organisers played a taped acceptance speech he had made in an interview with the organiser Martin Sahlén just before the event.

## NO, DEFINITELY NOT 1%

afb members were asked: Do you trust Amiga? and came up with the following results:

- CATEGORIES:
- No, definitely not
  - Not really
  - Definitely
  - S'pose so

# Product News...Product News...

■ **Aminet 32** is now available from the usual sources. It's freebie is a special version of **GoldEd 4** (4.8.0 to be precise) and it has more than 190MB of new files that have appeared since Aminet 31.

■ Following stories that people found the Power Tower A4000 easier to build than Richard's article last issue led them to believe, Power have said that the side panel, onto which you fasten your motherboard, can be lowered making for easier access.

■ **Photogenics v4.1** release 57 is now available as a free download for **Photogenics 4.x** users. The new version encompasses better docs, greater stability and new features.

■ **HydraBBS** gets a bug-fix. The changes from 1.07 to the new 1.08 are slight, but important and include fixing the broken `HBBS_SaveFile()` function.

■ **Myzar 2.0** is released. The new interface for the **RCS** challenge includes the ability to view PPC and 68k stats side by side for those wanting to assign both their processors to the task of cracking the **RCS** encryption. There are also other features, including a nice collection of moo sounds for when you complete a block.

■ **akWAIL** is a new datatype that the prolific **Andreas Kleinert** has added to his list. It recognises and displays **ImageFX** thumbnail files.

■ **BurnIT** is now up to version **2.50**. The new version enables you to copy CDs on the fly, supports PPC, much better drag and drop support and more.

■ **OS3.5** should be shipping by the time you read this, however, beta-testing is still proceeding as we write this, so there's no guarantee.

The design for the Aminet cases changes sooo regularly...

# Eyetech take on Nova

Nova Design have joined hands with Eyetech to offer Nova's products to the UK on an exclusive basis. Eyetech will be supplying the newly-finished **ImageFX 4**, **Aladdin 4D** and the **Wildfire 7** package being shown at the World of Amiga show by its author.

When asked about the deal, Eyetech boss Alan Redhouse had this to say: "If you have been reading Kermit Woodall's series in recent issues of *AF* then you'll know how powerful **IFX4** is, and why we are so pleased to have been chosen as Nova's exclusive UK distributor".

As an introductory offer Eyetech are giving 15% off the prices quoted in this issue for any of Nova Design's products (including add-ons and upgrades - proof of purchase required) until 30th September 1999.

Just clip out and send in this coupon below.

## It's a kind of Magic

**E**yetech have a special deal going right now for owners of base A1200s. We thought we'd let them explain it in their own words:

"There are still quite a lot of Amiga users who call us who have only got basic floppy disk A1200s. If that applies to you - or to someone you know - then here is a very special deal to bring your A1200 up to speed. Get the full Amiga Magic Pack software (Wordworth 4SE, Photogenics 1.2SE, Personal Paint 6.4, Organiser, Turbocalc, Datastore 1.1, Pinball Mania and Whizz) and SCALA MIM300 for just £44.95. This software is shipped fully licensed, ready to run on a 170MB 2.5" hard drive (but without backup diskettes or manuals - this is your responsibility). Although you only pay for the software the hard drive (which is otherwise unused) is yours to keep. Limited stocks are available. This offer expires 30th September 1999. Please specify whether you have 3.0 (V39.x) or 3.1 (v40.x) Kickstart ROMs when ordering."

Contact Eyetech on 01642 713185.

# Other news

## SUN MAKES MAJC

Sun Microsystems have announced that it is developing a processor targeted at the information appliance market.

This CPU is known as MAJC, Microprocessor for Java Computing, and pronounced 'magic'. Few details have been released regarding this architecture but it seems that the emphasis will be on the processing of multimedia data streams, perhaps similar to Intel's SIMD (Single Instruction, Multiple Data) extensions to the PentiumIII and Motorola's AltiVec technology.

Given Amiga's acknowledged partnership with Sun, MAJC would seem a perfect choice for future Amiga devices.

## LINUX FOR WORLD DOMINATION

The Linux momentum is pushing the free OS further into commercial areas. SGI have recently announced that it will be porting Linux to Intel's Merced processor when (or if) it is released. The future for IRIX, SGI's own proprietary flavour of UNIX, does not look so certain.

Also this month, Motorola has revealed a partnership with Caldera, makers of the OpenLinux distribution. The deal will allow the porting of Embedix, Caldera's embedded version of Linux, to Motorola's range of embedded processors, including the PowerPC, mCore and 680x0 series. Hopefully, the deal will see encourage the production of a PowerPC version of OpenLinux.

## KILLER 3D GRAPHICS CHIP

The oddly-named Finish hardware developers, Bitboys Oy, have unveiled the specs for their forthcoming graphics chipset, Glaze3D. It will initially ship in two versions the 1200 and the 2400, which can churn out 1200 and 2400 million 32-bit texels per second, respectively. This high performance is realized by removing the memory bottleneck from the system. The technology supports up to 18MB of DRAM embedded in the processor core as a frame buffer and up to 256MB of SDRAM on an external 128-bit bus. Volume production is targeted at Q1 2000.

## POWER EVOLUTION

IBM's POWER series of processors is set for another evolutionary leap when they unveil details of upcoming Power4 later this month. POWER is the RISC ancestor of the IBM/Motorola PowerPC collaboration and is used in IBM's AS400 and RS/6000 server families. The POWER4 will be the first in the range to feature two processors cores and an L2 cache on the same die and is intended for multiprocessing solutions.

## NetConnect 3

£49.95

program : netconnect  
version : v3  
format : cd-rom only  
available : early September - call for availability  
awards :

Now over a year since the release of the award-winning NetConnect 2, **NetConnect 3** will shortly be available. What is NetConnect? It is the easiest to use and most comprehensive commercial Internet compilation designed to enable any Amiga user, from novice to expert level, to get onto and use the Internet. By using the new Genesis Wizard, a user should be able to connect to the Internet in a matter of minutes. Containing Genesis, Voyager 3, Microdot-II, AmiIRC 3, mFTP II, AmTelnet 2, NetInfo 2, AmChat, Contact Manager, WebVision 2 and MetalWeb 3. Ideal for both an Internet dialup and/or local area network connection.

### Octopus [dock bar manager]

Octopus is a dock bar manager that allows you to have multiple dock bars on your Workbench. Launch bars from buttons, assign fastlinks to buttons, animated buttons, coloured/pattern buttons, image buttons and much more.

### Genesis [tcp/ip]

The Amiga Format award-winning TCP/IP stack. A TCP/IP stack is required to connect you to the Internet. Genesis contains an easy-connection Wizard, multiple provider support, multi-user support, cost logger, 'events' control, status window, controllable dialler, DHCP support etc

### Microdot-II [email/news]

A superb combined email and newsgreader within one GUI! Contains all the features you would expect - MIME attachments, support for POP3/APOP, search function, multiple signatures, multiple user support, Arexx port etc.

### AmiIRC 3 [irc]

Chat online with friends about topics, join conferences, organise mass meetings. The IRC is one of the most addictive elements of the Internet. AmiIRC 3 is the latest version of this client!

### NetInfo II [telnet]

NetInfo is a tool for analysing an (Internet) network and the people connected to it - 'finger' your friends to see if they are online, 'traceroute' a connection to monitor the speed.

### Contact Manager

Central management of web sites, ftp servers, chat channels, friends/users. Full multi-user support via Genesis. Store information which is accessible from Voyager, MD-2, AmiIRC, STFax, iBrowse, YAM, mFTP II and DOpus IIgn.

### WebVision 2 [web cam]

WebVision is a viewer program for a fairly recent phenomenon on the World Wide Web - web cameras. Web cameras are recorded images published on the web and updated at regular intervals. They may show everything from a TV channel or somebody's living room to a weather report.

### NetConnect v3 Upgrade from v2.x

£29.95

### NetConnect v3 Upgrade from NetConnect v1.x

£32.95

### NetConnect v3 Cross-Upgrade from Miami, iBrowse, AWeb - call!

£39.95

## STFax 4

£34.95

program : stfax  
version : v4  
format : cd-rom only  
available : yes  
awards :

**STFax 4** is a major update to our popular fax/voice software. New features since STFax 3.8 include 'auto-warn' (warn of an incoming call, generally or specifically or warn of a received message), 'auto-reply' (send automated replies to general or specific faxes), fax filtering (filter faxes based on caller id, remote id), distinctive ring (separate different calls made to two phone numbers, via one phone line), fax forwarding (forward general or specific received faxes to a remote fax number), customised cover pages (templates), caller transfers (transfer a caller to another extension or remote number, via flash-hook transfer), IO message mode filtering, new status window, over 60 professionally recorded voice messages. Enhanced features include a re-written fax on demand system, re-written remote access, re-written mini-BBS, enhanced interface, updated preferences, phonebook and fax viewer. Lots of other minor enhancements included.

What is **STFax**? **STFax** is a commercial fax/voice message program which enables you to use your Amiga as a digital answermachine. Send and receive faxes, create a simple or advanced tree based digital answer system for family members, create a fax on demand service, log numbers via caller-ID, call screen or blacklist phone numbers, set up a mini-BBS, use your modem as a telephone, control other programs etc.

- Full fax modem support (class 1, 2, 2.0) - fax from your favourite Amiga software
- Advanced voice capabilities - use your Amiga as an advanced (or simple) digital answermachine
- Support for the Independent Operation mode
- Mini-BBS - set up your own small BBS
- ScanQuix support - use ScanQuix to directly scan documents from your scanner into STFax!

### STFax v4 Upgrade From STFax v3.x

£19.95

### STFax v4 Cross-Upgrade from GPFax, TrapFax, MultiFax, FaxQuix - call!

£24.95

## High Quality, Branded Modems

from £59.95

Choose from three high-quality **branded** modems - the top of the range, award winning PACE v90, the new PACE 'Solo' v90 or the middle of the range Dynalink 'MagicXpress' modem (well built, compact design, same colour as your Amiga). All ship with a five year warranty. The PACE modem's additional features include free lifetime technical support, UK caller ID (only modem available which supports this), a superb speakerphone and volume slider/control. All PACE and Dynalink 'MagicXpress' modems are now v90 shipping ready - the agreed standard for 56K connectivity.

### PACE v90 Modem

### PACE 'Solo' v90 Modem

Dynalink v90 External Voice/Fax/Data Modem

£59.95

PACE v90 External Voice/Fax/Data Modem

£99.95

PACE 'Solo' v90 External Voice/Fax/Data Modem

£159.95

## Modem Pack Options

from £74.95

Various money saving packs are available. These are all based on the Dynalink 'MagicXpress' v90 modem. Packs based on PACE v90 or PACE 'Solo' v90 modems available at an additional cost.

Code	Pack Contents	£ Old	£ Sale
PK01	v90 Modem & STFax 4	£ 79.95	£ 74.95
PK02	v90 Modem & NetConnect 3	£ 94.95	£ 84.95
PK03	v90 Modem & NetConnect 3 & STFax 4	£105.95	£ 94.95
PK04	v90 Modem & NetConnect 3, Hypercom 1, STFax 4	£129.95	£119.95
PK05	v90 Modem & NetConnect 3, Hypercom 3+, STFax 4	£149.95	£124.95

ADD £40 for a PACE v90 Modem (instead of the standard Dynalink 'MagicXpress' v90)

ADD £100 for a PACE 'Solo' v90 Modem (instead of the Dynalink 'MagicXpress' v90)

\* All packs come with free, unlimited Internet connection - various options available

## High Speed Serial Cards

from £39.95

The revamped and recently relaunched **Hypercom** cards offer a number of different models for the A1200, A1200-T and Zorro Amiga's. The **Hypercom 1** is an A1200, clock port based, card offering 1 high speed serial port, the **Hypercom 3**, another clock port based card for the A1200, offers 1 high speed serial and 1 high speed uni/bi parallel port. The new **Hypercom 3+** offers 2 high speed serial ports and 1 high speed uni/bi directional parallel port. The **Hypercom 4+** offers 4 high speed serial ports and 2 high speed uni/bi parallel ports. Note that the Hypercom 1/3 cards are now 1D4 motherboard compatible. Software drivers and English documentation supplied. Call for more information.

Model	Machine	Specifications	Price
Hypercom 1	A1200	1 x 460,800bps highspeed buffered serial port	£39.95
Hypercom 3	A1200-T	1 x 460,800bps highspeed buffered serial port, 1 x uni/bi 500k parallel port	£69.95
Hypercom 3+	Zorro-2/3	2 x 460,800bps highspeed buffered serial ports, 1 x uni/bi 500k parallel port	£49.95
Hypercom 4+	Zorro-2/3	4 x 460,800bps highspeed buffered serial ports, 2 x uni/bi 500k parallel ports	£69.95

## DOpus Magellan II

£44.95

program : dopus magellan II  
version : v5.8  
format : floppy disks  
available : yes  
awards : amiga format gold, 95%

**Directory Opus Magellan II** is a complete Workbench replacement and/or file management based system. Magellan-II offers everything from file management (copy, rename, view, extract etc), dock bar creation (create your own dock bars - to launch programs, commands, scripts), advanced FTP functionality (with asynchronous operation), custom themes (24 bit icons, different backdrops, custom sounds and scripts, improved user and start menus (aka Windows start menus), greater lister functionality (with full drag and drop), custom menus and much more. Magellan-II is indispensable. Once installed and used, you will never want to go back to your 'original' Workbench ever again.

## DOpus Companion CD

£24.95

program : dopus magellan II companion cd-rom  
version : n/a  
format : cd-rom only  
available : yes  
awards : amiga format gold, 95%

The **Dopus Companion CD** - the ideal companion for the new Opus Magellan II that gives you that much more depth than the manual ever could! **Extensive documentation** - from power DOpus users, worldwide! **Coding** - the ins and outs of the extensive DOpus ARexx port and SDK by the best programmers around. **Filetypes** - We explain how to really get the most from the internal power of Opus. **Themes galore!** Special DOpus Themes can be immediately installed on your Amiga, plus megabytes of freeware and shareware themes. Lots of icons for StartMenus, Button banks and Amiga files and folders etc, plus specially designed sets of Toolbar icons from DOpus experts. Indispensable Opus ARexx utilities and scripts and many other related tools and accessories!

## DOpus Magellan II & Companion CD Bundle

£59.95

## Voyager v3

£24.95

program : voyager  
version : v3.x  
format : floppy disks  
available : yes  
awards :

Simon Goodwin's presence at the show was lucky since he was the only one in a position to bring you **all** the news...

**T**his year the World of Amiga show moved across London from Hammersmith Novotel to Kensington Town Hall, and was much improved as a result. Under the influence of AmigaSoc, who shared the organisation with long time WoA kingpin Peter Brameld, it combined the function of a commercial show with a gathering of the clans and development conferences, open to all. Seminars, competitions, usergroups and helpdesks

augmented the customary commercial focus. The main snag of the new venue was a dodgy set of telephone circuits, which caused some problems with credit card clearance, Internet connections, and the transatlantic linkup to US enthusiasts who shared the Saturday evening conference by 'phone and webcam. One AmigaSoc volunteer got a belt from the phone circuit when he tried to make a direct connection to link the continents, so we ended up with a handset taped to the microphone, and literal and metaphorical howls at each end of the link, but apparently the Americans heard all the speeches, only missing the promo video soundtrack.

**THE VENUE**

The show was spread across three floors, in the big, plush municipal building, using four main halls and ancillary rooms, including a couple of lecture theatres. Usergroups and an Internet café nestled above and below the main halls, which held *Amiga Format* and the big trade stands, with a stage at one end for Petro to demonstrate his inimicable microphone technique, dish out

awards, and the Annex dancers to strut their stuff. Amiga's stand had even more memorabilia, including AmigaCola, socks and even Boing shorts, as well as the usual themed matches, pens, CDs, mice and mats. The new release of classic AmigaOS, 3.5, was previewed on the big screen and explained in detail in the small hall upstairs, just one of a stream of informative presentations throughout both days.

There seemed to be rather fewer people from continental Europe than last year, though Dutch, French and German Amigans were conspicuous, and the North American contingent was bolstered by an enthusiastic posse from QNX in Canada. These people seemed to have been hand-picked for their diplomacy, and did not comment on the Linux volte face, but their friendliness and enthusiasm reinforced their widespread support among Amiga tech-heads.

**FUTURE SEMINAR**

The biggest hall, normally used for Kensington Council meetings, was commandeered by hundreds of Amiga users on Saturday night. A fast-paced

[All captions are clockwise from top left] The video wall was busy, the show was busy, even we were busy.

Our JC; our 100th subscriber of the show; the gang; Jens Schoenfeld (out of uniform); a trader; Brent Daniels of QNX; moi holding my bottle of champagne and plaque (thank you dahlings, for voting for me, I love you all...)

Microsoft's grotty PowerPoint rather than Amiga Scala presentation software, and Jim Collas gave the hackneyed excuse that he'd needed to edit it on his PC notebook on the flight over. But at least it didn't crash this time.

The slides duplicated those shown at the Heathrow conference months before, with a few company names edited out, and the speech was very similar. Jim forecast the growth in information appliances, overtaking computers, and the key technologies of 'AmigaObjects' and Java were introduced, but not explained. A passing mention of chipset developers Transmeta was greeted by a loud cheer from those who presumed to know rather more than the new Amiga company is currently letting on - which seemed to include most people in attendance.

Rick LeFavre tried to justify the

switch from QNX to Linux, citing real-time performance that trounced PCs but was unexciting compared with current Amigas, let alone existing QNX applications. Allan Havemose flashed up a slide of a new computer architecture, with PAL and NTSC video input and output, two PCI slots, seven USB connections, a couple of EIDE drives, and unspecified multimedia processors and software in the middle. Apart from that, and a TV-style mock-up concept cabinet, there was surprisingly little 'meat' to the presentation, and several apologies for commercial secrecy.

Despite attempts to show that something is happening, we still don't know a lot about the future Amigas, and ritual Microsoft bashing aroused the most response. The hall was set up for electronic voting, but there was no

Continued overleaf =>

but woefully transcoded video set the scene, tracing the history of the Amiga from Commodore, illustrating the original designers, the Escom wilderness and Gateway's initial dithering, before focusing on the new team and their plans for the future.

Petro Tyschtschenko introduced Jim Collas, joined on the podium by ex-Commodore OS overseer Allan Havemose and recent recruit Rick LeFavre, who worked for years at Apple and charmed us by saying 'sorry' when this was first mentioned. The new COO (Chief Operating Officer in US business-speak) Tom Schmidt was introduced, but said nothing - despite, or perhaps because of, rife rumours of an Initial Public Offering for new Amiga stock.

This presentation was pitched at the faithful, and the symbolic content got a rousing response, but there was little substance to the video, and it was worrying to see that the new Amiga company have a lot to relearn about camera work, video editing and standards. As usual since Gateway's takeover, the main presentation used

Amiga were busy; Simon was busy telling QNX that they were the best; Annex were busy doing calisthenics (or something); Kermit was busy clutching at passers-by; the stands were busy; Paul and wife were too and so was Alan Redhouse!

← attempt to gauge the preference for QNX over Linux. In fact there was not even the usual question and answer sequence after the speeches. The video ran again, and we filed out, encouraged but otherwise little the wiser.

TRADERS AND PRODUCTS

Power Computing introduced Punchinello, a PC mouse adapter for the Amiga controller port, which supersedes Topolino. Currently it supports Genius and Microsoft mice, with more to come, including extra buttons and mouse wheels.

They had their neat new Power Tower for A4000s on a separate stand, demonstrating the swivel hatch for easy motherboard fitting, which they failed to mention to Richard last issue. The Gold Edition PowerFlyer now comes with Allegro device drivers, claimed to outrun IDEFix. The unfinished A4000 version was previewed and should be even faster than the A1200 model, though a bit more expensive.

Power announced their intention to import Melody 1200 sound cards, reworked to rival Prelude, and Twister 1200, a new German serial interface with hardware handshaking. This advance for A1200 interfaces should prevent data corruption when software does not multi-task properly.

New software included the game Red Mars, WildFire7 video effects for PPCs, and Power Movie, a fast AGA animation replay system. Power even previewed their own Internet service, promising full Amiga software and support.

Eyetech introduced a remote-

control keyboard and trackball combo, originally made for PC users and since adapted for Amiga ports, plus their usual range of adapters and accelerators, and a video bargain, offering a 'free' 14 inch SVGA monitor to anyone who bought a £100 flicker fixer and £25 speakers.

Eyetech take Amiga usage seriously, running an impressive Amiga-powered network around their large stand.

All orders and enquiries were processed by

New hardware galore! The new 2040, 1240 and ZorroIV board from Power and the MCC. And (gasp!) the case designs for the NG and monitor.

an A4000/030 in the back room, connected to four bar code scanners and a couple of printers out front. Half a dozen serial and parallel connections from an IOBlix card and the Amiga motherboard allowed automatic invoicing and stock control, thanks to more than a dozen separate tasks running concurrently on the A4000,

querying and updating a SuperBase 4 database via ARExx scripts.

Jens Schoenfeld of Individual Computers was touting new multi-IO cards for A1200 clock ports, Catweasel and Buddha, but still no FlashRom or floppy-port MPEG. He's been busy changing address, servicing Apollo cards, and making boards for VBC. Atéo had a working Ethernet card for their ISA-based A1200 towers, but still no proper serial port drivers.

HiSoft had iBrowse 2 on sale for the first time, with Javascript support and their Net&Web TCP/IP bundle included in the £30 package or £12 upgrade price. Voyager 3 was previewed, and AWeb has been integrated into the new Amiga OS (see box).

There were mountains of games, especially CDs and old floppy titles at bargain prices, and two 43" screens for competitions and game demos.

BOXER SLIPS

Mick Tinker of Index Information and Blittersoft's Paul Lesurf took an unusually low profile in a corner of a shared stand. They had hoped to show working BoXeR systems, and Mick had yet another feature list and board design in his pocket, but recent re-design work meant that BoXeR again failed to show.

We gather that the original plan for a first-generation BoXeR based on Commodore chips was scrapped after a disagreement between Index and Amiga International. Faced with uncertain supplies and a big price hike, the designers opted to go it alone, re-engineering the Amiga chip set, rather than buying in Commodore's best effort and moulding a faster motherboard around it.

The new design has a unified memory architecture, so all memory is effectively 'chip RAM', but many times faster, allowing new modes and

Dario Pane showing off PowerMovie; Eyetech explain how to build a tower; Waaslandia (where the IRC conferences were held) and some of the (other) mags; Kickstart (holding up Amiga Insight); ASA; Seal (holding up AF - much better); multiplayer games; the abortive cybercaff; CAUG; WLAC; Michael Garlich of Titan; our stand (inset) and someone strange examining an accelerator,

## Paul Cavanagh gives his views on WoA as someone who has only recently returned to Amiga computing.

There's a terrible confession I have to make, so bear with me, this isn't easy. You see, up until I started work here at *Amiga Format*, my Amiga A1200 had been languishing forlornly in my parents' attic. I gave up on it when the assistant in my local branch of Game sneered at me when I enquired as to why there were no Amiga games on the shelf these days. That was two years ago. Naturally, it's now back with me, up and running, and it feels good to have it back. Given that I've got a lot of catching up to do, I jumped at the chance to attend the World of Amiga Show, so that I could meet you, the great Amiga public, and find out what Amiga are up to. It occurs to me that there are hundreds of thousands of people out there just like me, who have been neglecting the Amiga, and may well be excited to hear of the imminent rebirth of the Amiga. So here's my perspective as someone who feels nostalgic about Amiga computing, and is really rooting for Amiga to make this new project work.

Most of my time at the show was spent on the *Amiga Format* stand, selling *AF127* and subscriptions. This was a busy time and pretty tiring work, but it was a great opportunity to meet readers and gauge the mood of the Amiga community. I was quite taken aback by the level of feeling surrounding Amiga's decision to use Linux over QNX, and impressed at how well-informed Amigans are (we covered the story extensively in *AF127* and it was the last thing to go into the issue, so given that the magazine hadn't even been sent out to subscribers at the time of the show, it was impressive that most people even knew about it). I'm not sure that most people honestly felt that QNX was the best way forward, but I know that nearly everyone is sick of being mucked about by Amiga, and that this was one u-turn too many. So you're a well-informed, alert bunch. It was fantastic to hear so many of you talk with great enthusiasm about the Amiga (both classic and NG), and to be reassured that I was working for a magazine that is held in such high regard by its readership. So thanks to everyone who said nice things about the magazine. I really enjoyed asking people what they had bought at the show, and watching people producing an amazing assortment of goodies from various plastic bags and rucksacks, whilst enthusing about what bargains they had come across. It's good for those people who have now got new bits and bobs at great prices, it's good for the retailers, it's good for us because we might benefit from additional

advertising, and it's good for Amiga because they continue to have a core user base who in turn are supported by manufacturers and software developers. So that's good then. All in all, then, I was very impressed by you, the Amiga community.

I've got to say that I was less impressed by Amiga. The press conference was designed to wow, with Jim Collas sermonising very effectively. His demonisation of the great Satan that is Wintel was fun, while his deification of Amiga as the messianic saviour offering a New World Order in computing did have the effect of filling me with enthusiasm, leaving me breathlessly awaiting further announcements. But like most religious movements, it's easy to pick holes in the argument, and to point out hypocrisy. It was a grave error for Jim Collas to present his sermon using Microsoft's PowerPoint, a fact that was not missed by anyone present. I happened to be sitting right in front of the laptop that was being used for the presentation, and unsurprisingly it carried an 'Intel Inside' sticker. Not good, not good at all. While it is fun to hear Amiga slagging off Microsoft publicly, and while I accept that it is necessary to point out that an alternative is required, I thought it was a tad childish to repeatedly poke fun. It would have been better to have focused more on Amiga's strengths and less on Microsoft's weaknesses. I do recognise that it is part of Jim's style to get a bit carried away, and maybe this works in his favour. What is less forgivable is Amiga's lack of consideration to the Amiga community. To me, charging £10 for a ten minute promotional video is outrageous, especially given that Jim Collas was so enthusiastically trying to enlist support from the community. A charge of £2 to cover media costs would have been understandable, but it would have made much more sense to have given as many copies of the thing away as possible for nothing. I also apply this argument to the promotional lighters, socks, t-shirts and boxer shorts that Amiga were selling. The Amiga brand needs to be seen to be successful, so giving away t-shirts etc makes sense. And it doesn't do any harm to keep Amigans happy by given them a few freebies either. The worst insult of all was AmiCola, a really quite foul cola that Amiga were selling for £1. A quid for a can of cola? Not on your nelly. To be fair, Amiga did give away a few goodies if you hassled them enough, but they shouldn't have charged anyone in the first place.

All in all, it was a great show, and I'm looking forward to what the future has to offer the Amiga community. I was glad to get home, mind you, suffering as I was from a stinking hangover (for which I simply have to thank Tore Bjørnsen from Norway, cheers!), and feeling horribly, horribly tired. And I somehow made it into the office for 9:30 on Monday morning. See how dedicated we are here? Probably at least as dedicated as you Amigans who stick with your machines through thick and thin. Good on you.

Continued overleaf →

negligible performance loss when the processor and video compete for time. The Amiga's Direct Memory Access scheme has been extended so that most peripherals support fast DMA, increasing throughput and reducing

processor overhead. The ATX motherboard fits any standard PC case, with two 64-bit DIMM sockets, four active PCI slots, and five optional Zorro 3 expansion slots, driven through a fast serial bus. The twin IDE ports support

UltraDMA modes, and both printer and RS232 ports have DMA and buffers, for the first time on any Amiga compatible. BoXeR adds sockets for a PS2 keyboard and mouse, as well as the Amiga mouse and joystick.

Steven Flowers from Alive; makes you tired, don't it; Geoff Milne - give us a choon; there's a whole lot of gaming going on; the delectable Linda Campbell from QNX presents Paul Nolan with a QNX t-shirt (where's mine Linda?); purchases aplenty; Rich convinces that a sub is a good idea; while Weird Science convince that buying is a good idea; Tony just makes people offers they can't refuse; as Chris Wiles tries to convince people that NetConnect 3 is almost ready; this guy's playing that other one you know...

# THE WORLD OF AMIGA

Tim Corringham sells out of PFS2; Paul Nolan demonstrates the much improved Photogenics 4.1; all that running around makes people tired; while I try to get our sodding machine working. Although Saturday was plenty busy, the Sunday was dead by comparison – odd considering the cheaper tickets, etc.

Processors from 25 MHz 68040 to 75 MHz 68060 are supported, with a connector for a 64-bit PowerPC expansion. Index insist we'll be able to test their claim of 100 per cent Amiga compatibility before the end of the year, but as time passes BoXeR risks becoming overshadowed by the new Amiga architecture.

### MEDIA

For the first time, *Amiga Format* was the only professional publication on show. Alive mediasoft and Power Computing made their own attempts at dressing up catalogues as magazines, and *AmigaActive* touted a superficially thick mockup of their delayed launch issue, stuffed with facsimiles of *AF* adverts and interesting headlines, but meaningless random text

underneath.

These efforts were humbled by the real magazine from Essex users SEAL, which is 'amateur' in only the best sense. The third issue of their *Clubbed* fanzine is beautifully printed, although only the front and back are in colour, and apostrophes seem to be the editor's

“For the first time, *Amiga Format* was the only professional publication on show.”

blind spot. *Clubbed* is packed with interesting and informative articles, with issue 3 focusing on Amiga developments and the Internet.

Last minute Linux news missed the main 40 page A4 magazine, but was copiously discussed in a densely printed A4 stop-press supplement. With only 100 subscribers, *Clubbed* is clearly a labour of love, and deserves lots more support from print enthusiasts for whom *AF* is not enough.

### FINAL THOUGHTS FROM CHAIRMAN BEN

I didn't get much time to actually look around the show, what with all the meetings I had to attend, and people I had to see, but speaking to you lot has always been the best part of going to a WoA, and being able to put faces to the names I regularly see on the afb, or in general email is always nice. For me, the show was superbly organised, with far

## Amiga OS 3.5 Preview

Workbench 3.5 was still beta-testing as the World of Amiga show took place, but developer Jochen Becher was on hand with a big projector screen to demonstrate and answer questions about the operating system upgrade.

### COLOURS

The new Amiga OS supports 24-bit colour throughout, with datatypes and printer drivers extended for true colour images.

Third party packages do bits of this job, but it takes a new OS release to tie everything together, substantially benefitting graphics card users.

New Workbench icons use the 31 colour Glowicons palette, retaining Commodore's old four colour imagery as a fall-back, particularly for ECS Amigas with limited colour depth. Revised palette preferences are now dynamically updated, by redrawing the entire screen, in direct mapped colour modes.

The improved icon scheme supports images in up to 255 colours. Application icons can be animated, but not file icons. For instance, the release will include a windowless clock icon that updates anywhere on the screen. The icon editor is a vast improvement, with adjustable zooming and an option to automatically add the 'glow look' for selected icon imagery.

Olaf Barthel's code automatically converts images that used the NewIcons patch. Default icons are related to file types by a new database, allowing more variety and information on-screen, and smarter Applcons

can intercept menu messages like Rename and Info and respond appropriately.

Font preferences include a preview, reminiscent of the Workbench 3 palette editor, showing altered icon and window text instantly as you select different fonts. A new configurable 'fallback font' is used automatically when a window is too small to fit the required text in the normal default font. Preference windows are resizable and cope better with custom fonts.

### PRINTING

Commodore's printer drivers are woefully outdated, given developments since 1993, and limited to 4096 colours. The new OS transforms printer support, making it easier to use, more powerful, and compatible with modern printers and interfaces.

You can now configure up to ten printers of multifarious types on various ports, all with unique settings. The Printer and PrinterGraphics preferences are merged and extended. You can also 'print' to files or any network device via Envoy.

Colour settings update a preview photo of Amiga International's Nicole Gottfried, giving a much better idea of their effect on your printout. Page previews show true borders, illuminating for printers that cannot reach the whole page surface.

Standard datatypes include GIF and 24-bit JPEG; the new Picture datatype is RTG-friendly, and at last the Audio datatype works in stereo. Multiview supports all this, and can belatedly embed pictures on the same screen as text.

### EXTRAS

Any modern OS must include Internet software, and Haage and Partner has

## Richard Drummond took a (metaphorical) licking, but just kept on ticking

This year's World of Amiga show was not quite the experience that I had expected. This was actually nothing to do with the show itself; it was due to the fact that I had developed tonsillitis and Bell's Palsy in the previous fortnight. Not only was I in intense pain, but all the muscles in the right half of my face were completely paralyzed. Consequently, I looked like a cross between a Bond villain and a stroke victim and slurred my words like I'd downed a full bottle of whisky. As you can probably imagine, all this was not much fun for a social occasion like the WOA. Nevertheless, I armed myself with an economy-sized pack of Nurofen and was still determined to enjoy myself.

The hot topic of discussion for everybody at the show was Amiga's recent decision to dump QNX and opt for Linux as the kernel of choice for the next generation machine. Knees could be heard jerking all over the Amiga world when this announcement was made and, in fact, I myself was initially disappointed with the move. QNX seemed new and fresh; Linux dull. I do use and like Linux, but it's hard to picture Linux with all its baggage as revolutionary. But when you sit and think about the decision, it does make sense. The evolutionary force

behind Linux is remarkable. So, while at the moment, the monolithic Linux kernel may not be exciting, in a couple-of-update's time it could well be.

Perhaps the most interesting part of the show for me was the video conference on the Saturday evening. This was not because it was particularly informative, because it was not. But it was entertaining. The first performer was Jim Collas, high priest of the Church of Amiga, proselytising the Amiga dream and demonising the Wintel hegemony. Stirring stuff, at least for those less cynical than I. The congregation was even offered a brief moment's revelation during the Amiga promo video which was shown: the mystical name of Transmeta was flashed on the screen as one of Amiga's partners.

The next turn was the Rick Le Faivre and Allan Havemose double act. One might have thought that these two, playing more technical roles in the company, would have presented us with some solid facts. Alas, no. Their act was more convincing than Jim's but was largely a damage limitation exercise for the Linux decision.

This defensive attitude struck me as odd. If you listen to what Amiga are saying then you will realize that the choice of kernel does not matter. Most Amiga software will not see the kernel. Its services will be accessed through higher abstraction layers, APIs provided by the Amiga Operating Environment. Let me rephrase that: the kernel only matters with respect to each particular realization of NG hardware. New Amiga devices will more than likely be built with a wide range of different CPUs. The choice of kernel is irrelevant as long as they choose the right one for each particular CPU. So, if the Amiga MCC is built around Transmeta's wonder chip, then Linux makes sense. But it will not be a Linux kernel that anyone has seen before.

more going on than in previous years, largely thanks to AmigaSoc, but while the intentions were good, the execution wasn't always, and signage and announcements of events weren't as good as they should have been. The problems with the cybercafé were a shame, and the parking was expensive, but the venue was much nicer than the horrible Novotel (if only for the sheer quantity of places to eat on Kensington High Street!). However, like many people, I was muttering that a central London location for the show was not only too expensive and hard to get to,

but also not ideal for people who had to travel, from the depths of Scotland (or perhaps that should be heights? Highlands? Oh, never mind). In any case, I'm pretty sure we'll see the next UK Amiga show in a far more suitable location for the majority of Amiga users. Last, but not least, I'd like to thank all the usergroups for attending. Not only did they not "drag the tone down" as some worried, they positively improved the quality of the show for me.

For next year? If Amiga's plans are still working to schedule, it may be the

last large-scale classic Amiga show we see, if the NG does as well as we all hope. If that's the case though, we'll still be there saying hello to all those new and returned Amiga users desperate for info on their new and easy-to-use machines. It's a lot of "ifs" admittedly...

I may have been a bit distracted or seemed rude to you, if so I apologise – a lack of time prevented me being polite to everyone, but I hope to see you next year, when I'm sure we'll all be able to drink a toast to the new machine – "The Amiga is dead! Long live the Amiga!"

opted for a 'slightly cut-down' Miami Deluxe stack, plus a subset of the browser AWeb, with Javascript support. The email client is small but extensible, built on a powerful Amiga Message Library which promises fine net integration.

Other new libraries include HDlibrary, which collects 64-bit disk routines in one place, allowing vast drives in HDToolbox, and a Resource library that lets you edit and generate custom gadgets and interface hooks.

Shell improvements address date handling and larger drives, like versions of MOUNT and FORMAT that can see beyond 4GB. The installer can run on its own screen, with graphics and a new script command for easy back-tracking. Uninstallation remains a problem for the script-writer – it's possible, but not always simple.

The Workbench interface is subtly improved. Multiple files can be selected individually without using SHIFT, a rectangle or a third mouse button, and there are many extra keyboard short-cuts.

You can lock pointer movements vertically or horizontally when dragging, reducing alignment wobble, and scroll windows more easily with keys. Windows can be automatically resized to fit their contents, and the rather feeble Workbench 2 CleanUp operation is vastly improved, with options to arrange icons by name, time, size or type.

An extra control key lets you copy, rather than move, files within a volume. File copying operations now display a progress window, but Workbench is still single-threaded, so you can't copy more than one thing at a time. The authors of Scalos and Directory Opus will be relieved to hear this, but others will be upset that they still have to wait....

### COMPATIBILITY

The developers have declared that stability and compatibility are their primary aims for the new release of the OS, while slotting in new features

whenever practical. The update was criticised by WoA delegates who could see little difference from the current version, plus PD hacks.

Herr Becher explained that his team had spent five months preparing this update, without a new ROM, after five fallow years, and stressed that the changes under the bonnet are significant, but will take time to appreciate. Old hacks are often redundant, but compatibility is good – Birdie, MCP, NewIcons, SwazInfo, ToolsDemon, VisualPrefs and most of their ilk still work, though – as in the case of NewIcons – they might be entirely redundant.

At the time of the demo, the preferences editor for ReActor, the GUI toolkit, was not finished. This controls an extended ClassAct interface, for new gadgets and resizable windows, with control over borders, layout and spacing similar to those in MUI preferences. The reactor GUI generator will be included free in the Native Development Toolkit, scheduled for release a month or two after the main OS upgrade. Autodocs, examples and tutorials for developers will also follow then.

### FUTURE

Jochen Belcher made it clear that Amiga owners will have to buy the upgrade in large numbers to ensure further development. "The success of OS 3.5 determines the future of version 4.0. If it doesn't sell well, Amiga Classic is dead", he warned. The next OS upgrade will include a new ROM, allowing far more extensive improvements, but the development team reckon this will at the very least need a year of testing before it can be released.

Multi-threading, stream and editing datatypes, shared file tracking (for uninstall) and PPC support beyond the bundled WarpOS kernel are mooted for the next release. If all goes well, this could arrive late next year or early in 2001.

## LATEST NEWS IN BRIEF

### GREAT SUMMER SPECIALS FREE COMPAQ MONITOR

If you buy an EZVGA-Plus external compact scandoubler/flickerfixer and a pair of 240W PMPO amplified speakers (SPK-240W) before 30 September 1999 (or until stocks are exhausted), we will give you a 14" SVGA Compaq ERC monitor absolutely free (normal delivery charges apply). These monitors are ex-corporate replacements, fully tested and without screen burns or scratches. Call for further details.

### DIMAGE V CAMERAS BACK IN STOCK

When we announced the availability of the Dimage Camera 2 months ago we were inundated with orders and sold out completely within days (some purchasers were so impressed they ordered a second camera immediately after receiving the first!). Well, we have managed to buy the last remaining stock of this superb camera and the bundle price - complete with the acclaimed CamControl software for the Amiga (as well as Minolta's own Mac & PC software) is still just £259.95. (These cameras sold for over £800 just a few months ago). Briefly, these cameras feature:

- ✦ Swivelling 2.7x Minolta optical zoom lens with macro focussing to 5cm
- ✦ Removable smart-media card storing up to 60 images in JPEG format on the 2mb card supplied
- ✦ Auto-exposure flash, with daylight fill-in function
- ✦ LCD display for framing and replaying pictures
- ✦ Bi-directional serial interface for picture downloading, and the taking of pictures under computer control (ideal for webcam applications)
- ✦ 1m lens extension cable, so the lens can be mounted remotely from the camera for close-up or web-cam/surveillance work
- ✦ Truly pocketable size at 130x65x40mm (including zoom lens) and comes complete with soft carrying pouch and wrist straps
- ✦ Runs on 4 x AA batteries or from the mains PSU included
- ✦ Amiga, PC and Macintosh software included
- ✦ Full 12 months return-to-base Minolta UK warranty

### SPECIFICATIONS IMPROVED ON EZPC TOWER SYSTEMS

We are constantly striving to provide ever better functionality and value-for-money in all our products and none more so than our very popular EZPC-Tower expansion systems for the A1200. All EZPC Tower systems have now been updated to include:

- EZVGA internal scandoubler
- SMON video switcher and KMON keyboard switcher (for using the PC keyboard and monitor directly with your A1200 as an alternative to the Siamese RTG system)
- Unlimited internet access now included free of charge in all packages which have a modem included
- Hard drive upgrade option from 4.3GB to 17GB now just £99.95
- Faster PC processors on all models - please ring for details

And the best news of all - these increased specifications have been incorporated at no additional cost - making the EZPC route easily the most cost effective way of adding sophisticated expansion facilities to your A1200.

### BACKUP CD BURNING HAS NEVER BEEN CHEAPER

We have just purchased a batch of 2x2x6 bare CD ReWriter mechanisms - suitable for towers priced at just £139.95, or £179.95 complete with MakeCD software and one rewritable 650MB disk. Gold (write once) blank CDs are just £10 for 10 when purchased with any CDWriter/ReWriter mechanism.

### MAKE YOUR AMIGA NET READY WITH SANA II DRIVERS

Hydra Z2/Z3 Ethernet Cards now back in stock - just £99.95  
 A1200 PCMCIA ethernet cards and drivers just £79.95 (all A1200s need a CC\_RESET fix to operate reliably with any PCMCIA ethernet card).

### NOT TOWERED UP YET?

Now is the time to buy a MK4 EZTower

Until 30 September we are selling the MK4 Ready-to-Use EZTower for just £99.95 including power supply, LED adapter, floppy drive cable, faceplate and either a PC or A4000 keyboard adapter (PC keyboard £12.95, PC wireless infrared keyboard £39.95), genuine A4000 keyboard £34.95). And why not add a 24 speed CDROM, EZCD-XL buffered interface, cables and CDROM software for just £59.95.

### AMIGA-NG UPDATE

Preserve your investment with an EZTower

Amiga have announced that the Amiga-NG, (target availability Q1/Q2 - 2000) will be available as a PC-format motherboard. It will therefore fit directly into any EZTower Mk4 alongside (and networked to) your existing A1200.

### EZPC TOWER LINUX OPTION

For those who do not require the re-targetable graphics capability of the Siamese system we will be shipping the EZPC tower systems with the option of Linux installed on the PC side (with drives etc networked to the Amiga as in Siamese-based EZPC systems) from 1 September 1999. As Linux forms the basis of the development system for the Amiga-NG, and subsequent versions of the Amiga-OE, this forms the ideal platform for developers and users alike. As an added bonus you will not need either Windows 9x or Siamese software licences - so the cost of ownership will be lower as well. Ring for further details.

### MAGIC PACK UPGRADE SPECIALS WITH FREE HARD DRIVE

There are still a lot of Amiga users who call us who have only got basic floppy disk A1200s. If that applies to you - or to someone you know - then here is a very special deal. Get the full Amiga Magic Pack software (Wordworth 4SE, Photogenics 1.2SE, Personal Paint 6.4, Organiser, Turbocalc, Datasore 1.1, Pinball mania, Whizz and SCALA MM300) for just **£44.95**. This software is shipped fully licenced, ready to run on a 170mb 2.5" hard drive (but without backup diskettes or manuals - this is your responsibility). Although you only pay for the software the hard drive (which is otherwise unused) is yours to keep. Limited stocks are available. Offer expires 30 September 1999. Please specify whether you have 3.0 (V39x) or 3.1 (v40x) Kickstart ROMS when ordering.

## FIVE NEW PRE-CONFIGURED MK4 EZ-TOWER MAGIC PACK SYSTEMS

Although the basic Amiga International desktop console Magic Pack still represents excellent value for money (see the box-out below) more and more customers have been asking us for new Amiga 1200s which are already EZTowered up. So here they are, five pre-configured systems to suit different applicants and budgets. All systems come with brand new KS 3.1/WB 3.1 disk and manuals, mouse, 2mb graphics memory and a fantastic productivity software bundle including Wordworth 4SE, Turbocalc 3.5, Datasore 1.1, Photogenics 1.2SE, Personal Paint 6.4, Organiser 1.1, & Pinball Mania & Whizz games. Hard drive versions also come with Scala MM300 preinstalled.

If you don't have the need or the space for an A1200 Tower System then we can still supply brand new A1200 desktop console Magic Packs - either floppy drive only, or upgraded to a 170mb hard drive, EZCD-XL buffered interface and external CDROM socket with CDROM interface.

**A1200 170MB HD desktop console Magic Pack - £248.95**

**A1200 diskette desktop console Magic Pack - £179.95**

### OFFICIAL! Eyetech is now the exclusive UK distributor of Nova Design products

Nova's product range includes Image FX - probably the best image processing package of all time available for the Amiga - the Aladdin 4D solid modelling and rendering package and Wildfire animation effects and sound integration package.

If you have read Kermit Woodall's series in recent issues of AF then you'll know how powerful IFX4 is, and why we are so pleased to have been chosen as its exclusive UK distributor by Nova Design. As an introductory offer you can get 15% off the prices quoted in this issue for any of Nova Design's products (including add-ons and upgrades - proof of purchase required) until 30 September 1999 by sending in the coupon from the editorial section of this copy (128) of AFormat.

### EZBUS-Z4 ZORRO ADAPTER IS HERE!

Sorry for the delay but you'll find its worth the wait -

- Properly terminated Zorro bus
- 4 clock ports
- Standard AT style power input
- 5 x Zorro 2 slots, one with video slot (video slot adapter needed)
- Optional 19 MB/s 'Fast Zorro 2' mode
- 2 x 19 MB/s Z4 slots for graphics card and/or fast EIDE controller

And the price - just £129.95 until 30 September 1999 (£149.95 thereafter).

### LIMITED EDITION 1260/75LC 60 MIPS ACCELERATOR

Exclusively available from Eyetech - at a price lower than that of the 1260/50!

The fastest 680x0 accelerator for any Amiga is now available (exclusively) from Eyetech. Rated by Sysinfo at around 60 MIPS the accelerator is suitable for both desktop and towered A1200s. The integer processing speed of the 75MHz 060 is - in Simon Goodwin's words - 'awesome', being up to 2200% faster than that of an 030/50! A.I. recommend an '060 processor to get the most out of OS 3.5 - see separate news story below.

The 1260/75 LC comes with a full MMU but no FPU as no internal or external Motorola FPU module will work at these speeds. As most Amiga software is supplied with non-MMU versions, these should still easily out-perform the FPU versions on a lesser processor in all but a handful of cases. And now for the best news of all. You can have the fastest O/S-compliant Amiga on the planet for just £249.95! (Optional trade-in to MMU 060 within 30 days).

### NEW SPEC phase 5 PPC G3/G4 accelerators for the A1200 available this Autumn - official!

As we go to press, phase 5 have finally got off the fence and announced that they will definitely be manufacturing top end G3/G4 power PC boards for the A1200. And the specifications are awesome:

- ✓ socketted processor allowing future user-installable upgrades
- ✓ up to 1GB main memory via 2 x 100 MHz SDRAM (144pin DIMM) sockets
- ✓ 2 mini PCI connectors for SCSI, I/O or expansion or CybervisionNG graphics card (see below)
- ✓ 3rd mini PCI slot for additional cards or high speed active bus expansion
- ✓ 2 independent 12mbit USB channels with external connections
- ✓ 2mb upgradable firm ware via flash ROM
- ✓ full OS 3.5-compliant 680x0 emulator software to run your existing Amiga applications and software at amazing speed
- ✓ Choice of 300MHz or 400MHz PPC750 cpu with 1mb backside cache

The associated Cybervision NG card builds on the success of the high performance Bvision/Cybervision cards to offer:

- ✓ 32mb display and texture memory
- ✓ blindingly fast 2D/3D graphics chip with 128 bit 3D graphics engine
- ✓ supports resolutions up to 1920x1200 in 32 bit colour (4.3 giga-colours) at 72Hz refresh rate
- ✓ built-in video hardware accelerator which supports full screen, full-frame DVD video playback

We have already pre-ordered the full range of these exciting new products and will receive the first shipments to arrive in the UK. phase5 have given a target availability date of late September 1999, but more realistically - based on past experience with manufacturers time estimates - we would expect to be shipping in volume during October 1999.

Pricing has not yet been finalised, but we anticipate the G3/300 to be lower in price than the current top-of-the-range Blizzard PPC/240/60/50, with the G3/400 costing around being around 30% more. The Cybervision NG is expected to be around the same price as the current 8MB Bvision graphics cards.

## NEW!! ENGRAVED AMIGA 5.25" TOWER FACEPLATES FOR JUST £4.95!

**EZPC-PRO & NEW ENTRY-LEVEL EXPANSION SYSTEMS FOR YOUR A1200**

**3 pre-configured EZPC-Pro systems to suit different applications and pockets**

The EZPC system works by making the PC motherboard act as a slave processor to your A1200 - looking after the the operation of the systems accessories whilst you and your Amiga get on with creative work. (You can of course use the PC as a computer in its own right if you really insist!)

Its also important to understand that EZPC A1200 expansion system is based on a real Amiga and is not at all comparable with other PC-only systems running a clever, but slow, Amiga emulator as a PC application.

In fact there are such a range of applications that the EZPC system can open up to an Amiga user that we have introduced three systems pre-configured for different types of use. These are:

**A1200 EZ-PC TOWER-HSE (Home Studio Edition) - £999.95**

The HSE configuration comes complete with TV tuner with cut-and-paste teletext facilities, 24-bit video frame grabber and video clip capture card, 30 bit colour scanner, 56K modem and unlimited internet access at local call rates - as well as the standard EZPC system components

**A1200 EZPC TOWER-DVE (Digital Video Edition) - £1369.95**

The DVE is fitted with a purpose-designed, hardware-based MJPEG non-linear video editing suite for home/semi-professional video production. It also comes with built-in CD Writer/ReWriter (with drag-and-drop CD writing software) for producing your own audio and video CDs.

**A1200 EZPC TOWER-XLS - £1995.95**

This must be the ultimate creative multimedia expansion platform for your A1200. It comes equipped with non-linear video editing hardware and software, A4 30-bit flatbed scanner, DVD ROM hardware & MPEG 2 decoder (for DVD video playback), CD ReWritable drive, 15" Colour Monitor, 56k data/fax/voice modem with voicemail and internet software - and much more.

**A1200 EZPC TOWER-3.1+ - £395.95**

Finally, if your A1200 is feeling a bit tired we can supply your chosen EZPC Tower system with a brand new Kickstart 3.1 A1200, complete with Magic Pack software, 24 Speed CDROM, 3.2 GB hard drive (with W/b & Magic Pack software preinstalled), EZCD Mk4 interface and EZIDE software ready installed and connected up. All you need to do is to slot in your existing accelerator, fit your old hard drive into the external mounting drawer provided (see photo) switch on and start using your new A1200 EZPC Tower system.

All these three packs are designed for you to fit your existing A1200 in the EZPC Tower and connect it up. This normally takes around an hour, but if you would prefer to receive your system ready to use, we can arrange to collect your Amiga, do the work for you and ship your new system back all ready to plug-in to mains and phone outlets! Please ring for details.

**ENTRY LEVEL EZPC TOWER SYSTEMS NOW AVAILABLE FROM JUST £599.95**

**UPGRADE PACKS FOR EXISTING EZTOWER USERS JUST £499.95**

The EZPC-Pro Tower configurations (featured on the next page) have produced a tremendous level of interest - and orders - from professional and serious home Amiga users alike. We have also had many requests for a lower cost, entry level solution, from those Amiga users whose budget is more modest. So here it is - the EZPC-SLE - giving most of the potential of the EZPC-Pro systems (featured opposite) in an affordable (but expandible) package.

The EZPC-SLE specification is as follows:

- ✓ Full EZTower Mk4 with removable side panels
- ✓ PC Keyboard & EZKey-SE/PC adapter PSU (not with upgrade kit)
- ✓ 100MHz-bus motherboard with 4x UDMA IDE ports
- ✓ 2 x high speed serial & 1 x EPP parallel port
- ✓ 8MB SVGA SIS Graphics
- ✓ 3.2GB UDMA hard drive
- ✓ PC mouse
- ✓ Siamese 2.1 RTG serial Amiga-PC networking software and cable.
- ✓ TV/Teletext tuner with 24-bit still & video capture and Amiga composite video input
- ✓ EZVGA-INSD internal scandoubler and BMon switch to display your Amiga output on a PC screen
- ✓ EZVGA-INSD internal scandoubler and BMon switch to display your Amiga output on a PC screen
- ✓ 333M II CPU with 1MB cache memory
- ✓ 32MB 100MHz memory
- ✓ 16 bit 3D sound record and playback
- ✓ 24 speed CDROM
- ✓ Remote Amiga/PC keyboard switch

You will also need to have Windows 9x operating system and an SVGA PC monitor - see the panel on the EZPC-Pro Tower system panel for further information.

A collection, installation and delivery service is also available - please ring for details.

**EZVGA Scandoublers & Flickerfixers from just £48.95**

All scandoublers/flickerfixers allow the Amigas 15KHz modes to display on a PC SVGA monitor. Flickerfixers allow 15KHz interlaced screens to be displayed, rock-steady, at twice the standard vertical resolution. Other modes are passed through unaltered.

EZVGA-MK2	Compact, external, upgradeable scandoubler (to full FF)	£69.95
EZVGA-Plus	Compact, external scandoubler with full FF	£99.95
EZVGA-SEFF	Economy external scandoubler with full FF	£89.95
EZVGA-INSD	Internal A1200/A4000 scandoubler (not upgradeable)	£48.95
EZVGA-INFF	Internal A1200/A4000 scandoubler with full FF	£79.95
EZVGA-INFF2	Internal A1200/A4000 s/doubler with full FF for BMON	£89.95

**AMIGA SVGA MONITORS**

For use with Amiga Zorro & the new PPC Graphics Cards, Scandoublers & the EZPC-Tower system

- ✓ Special pricing on scandoublers/flickerfixers bought with monitors from just £45 extra
- ✓ Monitor specifications are quoted as the highest vertical refresh rate at the maximum resolution. Higher refresh rates (>=72Hz) at lower resolutions are available and give a more visually relaxing display.
- ✓ Scandoubler/flickerfixers have resolutions governed by the Amiga's AA/AGA chipset and are restricted to a maximum vertical refresh of 73Hz and a maximum usable resolution of 724Hx566V.
- ✓ The PPC BVision supports 1600x1280@72Hz. You will not gain the full benefit of this superb graphics card without a monitor that supports this resolution at that refresh rate.

14" SVGA 0.28DP, 1024Hx768V @ 60Hz	£89.95
15" SVGA 0.28DP, 1024Hx768V @ 60Hz	£119.95
17" SVGA 0.28DP, 1280Hx1024V @ 60Hz	£199.95
Engineering workstation grade monitor, 160MHz, Diamondtron tube.	
17" SVGA 0.25DP, 1600Hx1280V @ 75Hz	£399.95

SPECIAL OFFER 15" MONITORS FROM £99.95 - ring for details

**6 models of BMON are available from £39.95 - send for details**

The BMon takes two video inputs - one from an Amiga's AA chipset (either directly or via a scandoubler/flickerfixer) and the other from a graphics card (BVision, Cybervision, Picasso, Ateo bus card etc) - and switches your SVGA or multisync monitor between them. The BMon uses high quality video switchers so - unlike conventional switchboxes - there is no significant loss of quality from either source. It can also be used - in its SMon form - for switching an SVGA monitor between a PC and Amiga system. As standard the BMon accepts input from a BVision or Cybervision card and from an Eyetech EZVGA internal flickerfixer-2. It is manually switched by a remote miniature toggle positioned - for example - on the front panel of a tower system. The RMon switches keyboard output in an Amiga/PC dual configuration using the same control signals.

**The New Eyetech Mk 4 EZTower System - from just £79.95**

"This is definitely one of the easiest solutions to building your own Tower" - Amiga Format  
 "The Eyetech Tower offers clever solutions with a Velcro easyfit mentality" - CU Amiga

- ✓ The easiest way to re-house your A1200 by far
- ✓ Expand your system with EZPC (EZTower Mk4) or Zorro slots (EZTwr Z4)
- ✓ 250 W PSU with PC and Amiga power connectors
- ✓ No expensive PCMCIA right-angle adapter required
- ✓ Available in 5 models to suit different skills and budgets
- ✓ The only tower allowing both PC & A1200 in one case

CDROM & Amiga Audio mixer output*		EZKey input socket
250Watt PSU with monitor output socket		Amiga accel'tor* & optional BVision graphics card*
Space for standard PC motherboard*	All A1200 rear panel sockets are directly accessible	24.5" H x 7.5" W x 16.0" D
Individually removable side-panels		

**EZBus-Z4**

A new Zorro adapter from Eyetech featuring regular Z2 slots and 2x 19MB/s local bus connectors

**EZTower-Z4 - A new EZTower specifically designed to take the EZBus-Z4**

EZTowerZ4, k/b adapter, PC k/b & EZBus-Z4 £249.95  
 As above - introductory price - advance orders £199.95

**AWARD-WINNING UMAX SCSI FLATBED SCANNER**

- 600 x 300dpi optical resolution, single-pass 24-bit A4 flatbed scanner
- Comes with PhotoScope (Amiga) and Mac software. Compatible with all modern SCSI interfaces - including PPC, Blizzard & Classic Squirrel (but not Surf-Squirrel)
- PCW 'Best Scanner of 1998' Award - July 1998; PCW 'Best Scanner' September 1998
- Highly-acclaimed ArtEffect-SE v1.5 (normally £59.95) free with this bundle whilst stocks last...

**lower prices** **NEW**

**REMAINING STOCK of Amiga UMAX Scanner & PhotoScope/ArtEffect Bundle now just £149.95**

**The Top-Rated CD-Plus Range for the A1200**

'Eyetech have come up with a real winner with this new CDROM drive' - Ben Vost, AF  
If your A1200 hasn't got a CDROM then you don't know what you're missing!

At these prices there is really no excuse!

- Whisper quiet 24 or 32-speed CDROM mechanism
- EZCD-XL 4-device buffered interface, 3-conector 40-way and 2-conector 44-way cables included
- CDPlus driver software specially written for Eyeteck by the author of IDE-fix
- Optional Amiga and CDDA audio mixer with Gold phone audio jacks - just £14.95 each
- 20-watt CE-approved PSU complete with 13A plug
- Optional upgrade to MiniTower or Desktop case with 230W PSU (which can also hold extra drives and power your Amiga, just £21.95)
- 2 Free CDs whilst stocks last

**lower prices**

Complete CDPlus Systems: 24-speed just £74.95, 32-speed just £84.95  
Bare mechanisms for Towers: 24-speed just £34.95, 32-speed just £44.95!

**EZReWriter CDROM Burners**

Make your own music and data CD's, back up data for less than 0.15p/MB.

- Both are IDE/ATAPI reader/writer units with MakeCD Amiga writing software
- EZWriter units cut 'Gold' CD blanks at 2x speed & read CDROM's at 8 speed
- EZReWriter units cut 'Gold' CD blanks and CD rewritable disks at 2x speed and read conventional CD's at 6x speed
- Gold 650MB CD blanks (for use with either model) are available at ten for £10 at time of purchase
- CD rewritable disks are just £5 each when bought with the EZReWriter

**lower prices**

**EZReWriter Options**

EZReWriter-Bare for A4000 or A1200 Tower (bare drive - no MakeCD)	£139.95
EZReWriter-INT for A4000 or A1200 Tower (with MakeCD)	£179.95
EZReWriter-SE External A1200 CD ReWriter with separate 100w PSU	£219.95
IDE interfaces	EZCD-SE-IF, 44-way & 40-way cables & CDROM s/w - add £20
if required ...	EZCD-Mk4 VF, 44 & 40-way cables & EZ-IDE s/w - add £30
	IDE-Flyer interface, cables & s/w - add £50

**APOLLO Accelerators for the A1200**

**1230/40 TURBO PRO MK3**

High performance 1 or 2 simm entry level accelerators for A1200 desktop consoles or tower systems  
MMU, FPU & 1 SIMM socket to 32MB only **£59.95**  
MMU, FPU & 2 SIMM sockets to 64MB only **£69.95**

A1240/28 '040/28MHz/MMU/FPU*	(21 MIPS)	£124.95
A1240/40SE '040/40MHz/MMU/FPU*	(30 MIPS)	£167.95
A1240/40 '040/40MHz/MMU/FPU*	(30 MIPS)	£184.95
A1260/50 '060/50MHz/MMU/FPU*	(39 MIPS)	£264.95
A1260/66 '060/66MHz/MMU/FPU*	(51 MIPS)	£349.95
A1260/75LC '060/75MHz/MMU*	(60 MIPS)	£249.95

**TIP** Buy your memory with the accelerator to ensure full compatibility

\*To 32MB. Optional 2nd simm socket (tower only) offers 64MB total

The Apollo 1260/75LC is the fastest Operating System-supported Amiga accelerator currently available

20% off memory prices when bought with an Apollo or phase5 accelerator

**phase5 PowerUp A1200 PPC + '040/'060 Accelerators**

Without SCSI (not upgradeable) inc. MMU & FPU

160 MHz 603e PPC '040/25/MMU FPU only	£199.95
160 MHz 603e PPC '060/50/MMU/FPU only	£479.95
240 MHz 603e PPC '040/25/MMU/FPU only	£319.95
240 MHz 603e PPC '060/50/MMU/FPU only	£549.95

Add just £25 to the above prices for factory fitted on-board Fast SCSI II Interface

**Blizzard Vision PPC 8MB Graphics Card**

Unbelievable quality and speed - 1600x1280@72Hz!

No Zorro slots needed!

NEW! 8mb card - £159.95 or just £139.95 with a PPC

The fastest, most highly specified graphics card you can buy for your A1200

**A1200 Clock Port Expansion Cards**

For non-Zorro A1200s the best expansion route is via the (unused) clock port

PortJunior Mk2	1x 460kb serial port	39.95
IOBlx1200S	1x 1.5 MB/s serial port	49.95
IOBlx1200P	1x EPP parallel port	49.95
(Drivers for PC parallel port scanners, Zip drives etc., available shortly)		
PortPlus Mk2	2x460kb serial & 1x800kb parallel port	69.95
Catweasel-2	HD Amiga/PC floppy controller	49.95
ClockUp	4-way clock port expander	19.95

**Prelude 16bit Hi-Fi Full Duplex Sound Card**

"Easily the best A1200 sound card so far" - Tony Horgan, AF April 99

- Clockport fitting - no Zorro slots required
- Simultaneous recording, playback and mixing
- MIC, CD, AUX (Amiga audio) & line 3.5mm jack inputs. 3.5mm jack output to speakers.
- Mixes CD & Amiga audio etc., automatically on bootup without invoking application programs.
- Extensive software support including Samplitude, Octamed SS & AHI drivers & PPC-based MPG3 audio playback

Desktop: £129.95 Tower: £149.95 Zorro: £189.95

Parallel & Serial expansion for Zorro-based systems

IOBLIX expandable Z2 I/O card for Tower Systems 2xS, 1xP - £89.95

**OS 3.5 UPGRADE ... OS 3.5 UPGRADE**

OS 3.5 is on track for delivery in a few months time, so now is the time to start preparing your A1200 to be OS 3.5-ready. We will be shipping OS 3.5 (estimated price £34.95) from the date of its official release. Why not place an advanced order to ensure you get your copy at the earliest opportunity? Amiga Inc recommend the following configurations:

**For 'acceptable' performance:**

'030 accelerator	ACC-030-40-1S	£59.95
Scandoubler/Flickerfixer	EZVGA range	from £48.95
Modem	MOD-56K 56K	£69.95

**You will also need:**

3.1 ROMs	SYS-KS31-ROM	£29.95
... or SYS-KS31-MPUG (w/3.1 disks and MP s/w)		£49.95

**To take full advantage of OS 3.5:**

'060 Accelerator	ACC-060-50	£267.95
16-bit sound card	ADPT-AUD-PL12-DT	£129.95
I/O Accelerator	INT-SER-PTJR	£39.95

**The ideal way to update your Commodore A1200**

**MAGIC UPGRADE PACK**

- EZKey2**
  - Autodetects and remaps Amiga & PC keyboards
  - Plugs directly into the ribbon cable slot on the A1200
- EZKey2 alone - for A1200 only - just £28.95**
- EZKey2 and Windows keyboard £38.95**
- EZKey2, A4000 keyboard £58.95**
- EZKey-SE**
  - Separate models for Amiga & PC keyboards
  - Amiga version & kb detects all multi-key combinations
- EZKey-SE/Amiga - for A1200 & A600 - just £18.95**
- EZKey-SE/Amiga A4K keyboard £48.95**
- EZKey-SE/PC - for A1200 & A600 - just £24.95**
- EZKey-SE/PC and Windows keyboard £34.95**

**Image FX4, Aladdin 4D**

**Wildfire**

Superlative graphics, animation and effects software for your Amiga from NOVA Design.  
IMAGE FX4 - £149.95  
IFX2⇒IFX4 u/g - £99.95  
IFX3⇒IFX4 u/g - £74.95  
Powerstation IFX Module - £74.95

ALADDIN 4D - £59.95 WILDFIRE - £99.95

**Scala MM400**

The best ever presentation and video editing software for the Amiga with extra backgrounds & fonts. Guaranteed to make MS PowerPoint users' jaws drop.  
MM400 - £59.95 MM300⇒MM400u/g £39.95

**UltraConv 4**

The most comprehensive still image and animation conversion software available. Has over 130 built-in effects, batch conversion, QT AV builder w/audio, etc  
UC4 - £39.95 UC4 bought with SQ4 £29.95

**ScanQuix 4**

The definitive Amiga scanner driver for most Epson HP, Artek, Mustek & Canon SCSI scanners & Epson parallel. Also ScanExpress 6000P via the IOBlx12P.  
SQ4 - £59.95 SQ3⇒SQ4 u/g £29.95

**PhotoScope**

Software specially designed for the award-winning UMAX 610S, 1200S & 1220S SCSI 30-bit A4 flatbed scanners by the author of ScanQuix.  
PHS - £59.95 PHS/ArtEfx/Umax Scanner - £149.95

**CamControl**

Digital Camera serial interface control & download software for the Amiga for most popular Kodak, Fuji, Casio, Minolta, Mustek & Olympus digital cameras.  
CamControl - £29.95

**Samplitude**

The definitive Amiga hard disk recording, sampling and FFT filtering package. Samplitude Opus allows virtual (non-destructive) projects of 16 tracks (4 in LE)  
SampOpus - £149.95 SampOpus-LE - £49.95

**Siamese RTG**

The out-of-the-box Amiga-to-PC networking software which also allows you to use the PC's screen as a high res Amiga graphics card. 2.5 uses ethernet, 2.1 serial  
SiSysRTG-2-1 - £19.95 SiSysRTG-2.5 - £89.95

**MakeCD**

The best CD-burning software for the Amiga, with extensive audio-CD support. For most SCSI & some ATAPI CDWriters/ReWriters. Bundled with EZWriter.  
MCD3.x - TAO-Private - £38.95

**Netconnect**

The all-in-one internet package for the Amiga including 11 highly integrated programs covering all internet-related activities from email and Web to newsgroups.  
NC2.x - £49.95 NC2.x & NET-ISP - £69.95

**TurboPrint 7**

The most comprehensive, fastest replacement system for your Amiga. Supports the latest printers from most main manufacturers. Colour correction, spooling etc  
TB7.x - £38.95 TB6.x⇒TB7.x u/g £19.95

**Miami**

The definitive 'click and go' TCP/IP stack for the Amiga with built-in dialer. Essential for internet access or networking your Amiga to other computers.  
Miami 3.x - £24.95

**Workbench**

Official Workbench disks for your Amiga. All packs include hard disk install software. WB3.1 & WB3.5 require 3.1 Kickstart ROMs (also available from us).  
WB3.0 - £9.95 WB3.1 - £14.95 WB3.5 - £34.95 (est)

**EZ-IDE**

The best replacement 4-device hard disk driver software available for a stock A1200/4000 which also supports ATAPI CDROM, CDWriters, LS120 & Zip drives.  
EZIDE: £34.95 EZCD s/w⇒EZIDE u/g £14.95

- WB2.x WB3.x Floppy disk
- CDROM PPC ready AREXX enabled
- Special bundle prices may apply - please ring
- Upgrade/trade-in price available - please ring

UK Bank/BS cheques, Visa\*, Mastercard\*, Switch, Delta, Connect, Solo, Electron. Postal/Money orders accepted. (\*A 3% charge applies to all credit card orders). Due to space limitations some of the specs given are indicative only - please ring/write for further details. Please check prices, specification and availability before ordering. If ordering by post, please provide a daytime telephone number. Goods are not supplied on a trial basis. A1200 items are tested with a Rev 1.D.1 motherboard - other boards may need modification. Items subject to mechanical wear & tear (eg keyboards) are limited to 90 days warranty on those components. E.&O.E. All prices include VAT at 17.5%. Orders sent outside the EC do not incur VAT - divide the prices shown by 1.175 to arrive at ex-VAT prices. All goods are offered subject to availability and our standard terms & conditions, a copy of which are available upon request.

**UK Next Day Insured Delivery Charges: Software/Cables, EZCD I/F = £3.00**  
**2.5" Drives, Accelerators, Manuals = £7.00, 3.5" Drives, FDDs, PSUs, SX32 = £9.00, CDPlus, Miniotower, Desktop = £11.00, EZTW & EZPC = £15.00.**  
**Worldwide in 2-7 days from receipt of fax order & payment details.**

Due to variations in exchange rates the prices of some products may change - up or down - from the prices shown. Please ring or check our website [www.eyetech.co.uk/MAIN/APRICE.HTM] for the latest prices before ordering.

<b>Interfaces and Adapters: EZ-Key, DIY Tower Components</b>			
ADPT-EK2K	Mk 2 Amiga/PC k/b adapt -> A1200 kbd direct connect	28.95	
ADPT-EK2K-W95	Mk2 Amiga/PC k/b->A1200 dir connect +Win95 kbd	38.95	
ADPT-EK2E-A	EZKey-SE Amiga Sp DIN k/b adapter for A1200/A600	18.95	
ADPT-EK2E-A/K	EZKey-SE Amiga + 6p->5p adapt + A4000 kbd bundle	48.95	
ADPT-EK2E-P	EZKey-SE PC Sp DIN k/b adapter for A1200/A600	24.95	
ADPT-EK2E-P/K	EZKey-SE PC k/b adapter for A1200/A600 + Win95 kbd	34.95	
ADPT-HD-3/5	2.5"/44way->3.5"/40w-4w adapt & 2.5->3.5 mtg bracket	11.95	
ADPT-HD-3/5	3.5" Zip/SQuest/FDD/HD brkt/pt -> 5" bay	5.95	
ADPT-KBD-5P6P	Amiga/PC k/b adapter 5p din/f -> 6p mid-M	5.95	
ADPT-KBD-6P5P	Amiga/PC kbd adapter 6p min/f -> 5p/d-M	5.95	
ADPT-FDD-FF	Tower faceplate adapter for A1200 int F	4.95	
ADPT-TWR-AFSIN	Engraved 'AMIGA' faceplate for 5.25" tower bay	4.95	
<b>Interfaces and Adapters: A1200 Ethernet, SCSI</b>			
ADPT-PCM-ETH-C	PCMCIA ethernet card with Amiga/PC drivers	79.95	
ADPT-PCM-ETH-H	Hydra PCMCIA ethernet card with Amiga drivers	129.95	
ADPT-PCM-ETH-Z2	Hydra Z2/3 Ethernet Card	99.95	
CAB-UPT-460C	Crossed twisted pair/RJ45 for Sys 60cm	6.95	
CAB-ETH-3M	Ethernet Coax + 2 x terminator 3m	9.95	
ADPT-SCSI-CSQR	Classic Squirrel PCMCIA SCSI i/f 50pCM	69.95	
<b>I/F &amp; Adapters: Flickerfixers, Genlocks, Video Digitisers</b>			
<b>VGA Adapters, Monitor Switches, Monitor Leads</b>			
ADPT-VGA-BV8M	BVision BMB gfx card for A1200 (needs PCP)	159.95	
ADPT-VGA-BMON/F	SVGA Monitor Switcher - BVision/CVison & EZGVA INFF2	39.95	
ADPT-VGA-BMON/V	SVGA Monitor Switcher - BVision/CVison & 15pHD In/Ex SD/FF	44.95	
ADPT-VGA-BMON/A	M/Sync Monitor Switcher - BVision/CVison & 23p RGB socket	44.95	
ADPT-VGA-BMON/F	SVGA Mon Switch - Ateco/Picasso 15pHD Gfx & EZGVA INFF2	44.95	
ADPT-VGA-BMON/V	SVGA Mon Switch - Ateco/Picasso 15pHD & 23p RGB socket	49.95	
ADPT-VGA-BMON/A	M/Sync MonSwitch - Ateco/Picasso 15pHD & 23p RGB socket	39.95	
ADPT-VGA-AMON	Auto Amiga/C164-3D m/sync monitor switch	69.95	
ADPT-VGA-H25D	EZ-VGA-MK2 compact external s/doubler PLL upgradeable	69.95	
ADPT-VGA-PLFF	EZ-VGA-Plus compact external SD+FF 23F-15F PLL	99.95	
ADPT-VGA-SDUG	SDBL2 to SD+flickerfixer u/g	40.00	
ADPT-VGA-INSO	EZ-VGA internal A1200 s/doubler non-upgradeable	48.95	
ADPT-VGA-INSO2	EZ-VGA internal A1200 s/doubler for use with BMON	59.95	
ADPT-VGA-INFF	EZ-VGA internal A1200 scandoubler w/ flickerfixer	79.95	
ADPT-VGA-INFF2	EZ-VGA internal A1200 SD+FF for use with BMON	89.95	
ADPT-VGA-SEFF	EZ-VGA-SE scandoubler+flickerfixer 23F-15F Xtal	89.95	
ADPT-VGA-15M9F	Adapter from 15p HD-M VGA to 9p-D-F	9.95	
ADPT-VGA-9M15F	Monitor adapter 9p D-F to 15p HD-M	9.95	
ADPT-VGA-15M23M	VGA 15pHD-M -> 23p-M Amiga RGB adapter	12.95	
ADPT-VGA-UNBF	Amiga 23p-D-F -> 15pHD-F VGA adapter	16.95	
ADPT-VGA-BUF	Amiga 23p-D-F -> 15pHD-F buffered adapter for A4000	94.95	
ADPT-PGB-24RT	ProGrab 24-RT Amiga par. port video digitiser (no psu)	9.95	
ADPT-PGB-PSU	PSU for ProGrab 24-RT	69.95	
ADPT-GLK-COMP	EZ-Gen composite video Genlock for A1200	129.95	
<b>Interfaces and Adapters: A1200 Sound cards &amp; Software</b>			
INT-AUD-PL12-DT	Prelude1200 for A1200 DT console only	149.95	
INT-AUD-PL12-TW	Prelude1200 for Tower w/ribbon cable/I/O brkt, CD i/f	20.00	
INT-AUD-PL12-UG	Upgrade node from PL12-DT to PL12-TW	189.95	
INT-AUD-PL12Z	ZorroLore 16-bit full duplex sound card	149.95	
ASW-SMP-OP	SampleRate Opus 16 channel, virtual projects, FFT filtering	49.95	
ASW-SMP-LE	SampleRate-LE 4 channel, virtual projects, FFT filtering	54.95	
<b>I/F &amp; Adapters - IDE/ATAPI &amp; Software</b>			
INT-IDE-FLTR	Elbox 4-dev 32 bit high perf buf'd A1200 IDE i/f	28.95

INT-4K1-CD4	4-device IDE i/f for A4000 w/CDROM s/w	34.95	
DVR-EZIDE	EIDE/ATAPI HD/CDROM/ZIP/LS120 5p/Std dvr	14.95	
DVR-EZIDE-CU	P/x upgrade to EZIDE from competitive product	9.95	
DVR-EZIDE-SP	EIDE/ATAPI enhancer/CDROM Software Bundle Price	39.95	
<b>I/F &amp; Adapters-Serial, Parallel, Floppy, Clock port expanders</b>			
INT-SER-PTJR	PortJunior Mk2 - 460KB serial i/f for A1200	30.00	
INT-121-PTJR-SP	PortJunior Mk2 hi-speed ser i/f pur with CamControl s/w or KBPlus	49.95	
INT-IOBL-12	IOBlx 12S - 1.5Mbps serial i/f for A1200	49.95	
INT-IOBL-P12	IOBlx 12P - EPP parallel port i/f for A1200	69.95	
INT-SER-PTPL	PortJus Mk2 - 2x 460KB ser + 1x 800KB par i/f for A1200	119.95	
INT-IOBL-Z2	IOBlx 12Z - 4x1.5Mbps ser + 1x EPP par port ZorroII	19.95	
INT-IOBL-Z2PX	1x EPP par port expan for INT-IOBL-Z2 (to 4x+2xP)	9.95	
INT-CLK-EXP	ClockUp 4-way clock port expander for A1200	9.95	
INT-FDD-DFO	Interface for std Sony FDD for DFO 880KB	9.95	
<b>Cables &amp; Cable Adapters: Audio &amp; Mains</b>			
CAB-AUD-CD	CDROM invrt'd audio cab 6m + 2xRCA p/g	6.95	
CAB-AUD-MIX	RCA(phone)-M -> RCA-M+RCA-F 'mixer lead 1.8m	6.95	
CAB-AUD-2P2C	RCA(phone)-2xM -> RCA2xM stereo lead 1.8m	5.95	
CAB-AUD-MJ/PH	3.5mm st minijack->2phono-M plugs 1.2m	3.95	
ADPT-AUD-MJF23M	2.5mm stereo jack to 2 x phono male	2.50	
ADPT-AUD-RCA	RCA(phone)-M -> 2xRCA-F gold 'mixer T' mixer	2.50	
ADPT-AUD-RCA-G	RCA(phone)-M -> 2xRCA-F gold plated adapt 'T' mixer	2.50	
CAB-IEC-1.5M	AC power cable 1.5m plug -> IEC sct 1.5m	2.50	
PLUG-IEC	Reusable IEC monitor plug for PSUs/MT/DT	4.95	
<b>Cables &amp; Cable Adapters: Serial, Modem, SCSI, Printer</b>			
CAB-SER-EK2M	DB25-M -> DB25-F RS232 extn cab 1m for modem	7.95	
CAB-SER-EK2SC	DB25-M -> DB25-F RS232 extn cab 0.5m for modem	9.95	
CAB-SER-NUL2M	Null modem cable w/ D9F & D25F at each end 2m	14.95	
CAB-SER-NUL5M	Null modem cable w/ D9F & D25F at each end 5m	19.95	
CAB-SER-NUL10M	Null modem cable w/ D9F & D25F at each end 10m	19.95	
ADPT-SER-25F9M	25p-F to 9p-M serial RS232 adapter	4.95	
ADPT-SER-25M9F	25p-M to 9p-F serial RS232 adapter	4.95	
ADPT-SER-9M9M	9p-M to 9p-M serial RS232 gender changer	4.95	
ADPT-SER-9F9F	9p-F to 9p-F serial RS232 gender changer	4.95	
ADPT-SCSI-50/50CF	Centronics 50p-F to Centronics 50p-F (for Squirrel)	14.95	
CAB-SCSI-25D/50C	SCSI cable DB25-M to Cent50-M 1m for PPC	9.95	
CAB-SCSI-25D/25D	SCSI cable DB25M to DB25M mac type 1M	9.95	
CAB-SCSI-50C/50C	SCSI cable Cent50M to Cent50M 1M	9.95	
CAB-SCSI-50H/50C	SCSI-2 cable 50H/pDM to Cent50M 1m for PPC	19.95	
CAB-SCSI-50H/25D	SCSI-2 cable 50H/pDM to 25D-M 1m for PPC	19.95	
CAB-PAR-FULL	Bidirectional printer cable all pins connected	9.95	
<b>Cables &amp; Cable Adapters: VGA, Keyboard, Switchboxes, Cables, Scart Cables</b> (see also BMON, SMI/ATI switchboxes above)			
ADPT-SW-5/5K	Dual monitor, k/b & mouse switchbox	14.95	
ADPT-SW-5/5M	Dual monitor, k/b & mouse switchbox	19.95	
CAB-KBD-HM	5p DIN M - 5p DIN F k/b ex cable 1.2m	7.95	
CAB-KBD-MM	5p DIN M - 5p DIN M k/b ex cable 1.2m	7.95	
CAB-VGA-HM	15p DM-HD - 15p DF-HD VGA ex cable 2m	9.95	
CAB-VGA-MM	15p DM-HD - 15p DM-HD VGA cable 2m	9.95	
ADPT-SCAR-CHP	Amiga comp video (RCA)+2xAudio to SCART	12.95	
ADPT-SCAR-RGB	Amiga 23p+2xRCA to RGB TV SCART + audio	12.95	
<b>Cables: HD, CDROM, Floppy, Clock Port Data, A1200 Hard Drive</b>			
CAB-PD-4044F	2.5" (44F) to 3.5" (40F) data card adapt for A1200 30cm	9.95	
CAB-PD-2Z	Power splitter floppy drive to hard drive + floppy	9.95	
CAB-PD-30C	44 to 40way 3.5" HD data & 3p cabs - A1200	14.95	
CAB-HD-4IT	A1200 full 3.5" hard drive fitting kit	24.95	
CAB22-2W-10C	22way-F x2 A1200 clock port cable 10cm o/a	5.00	
CAB34-2W-50C	34way-F x2 FDD ribbon cable for tower 50cm	9.95	
CAB40-2W-20C	40 way IDE cable 2 connector 20cm	5.00	
CAB40-3W-1M	40Way IDE/HD/CD cable 3 connector 1m o/a len	9.95	
CAB40-3W-60C	40w-F x3 HD/CD/IDE cable 20+40=60cm o/a	9.95	
CAB40-CUST	Custom cable 3x40way IDE up to 1.5m	19.95	
CAB44-2W-13C	44way (2.5" HD) cable 2 connector, 13cm o/a	9.95	
CAB44-2W-60C	44way (2.5" HD) cable 2 connector, 60cm o/a	12.95	
CAB44-3W-12C	44way (2.5" HD) cable 3 connector, 12cm o/a	14.95	
CAB44-3W-24C	44way (2.5" HD) 7+17cm, 2 connector, 24cm o/a	14.95	
CAB50-CUST	Custom cable 50way SCSI 60cm w/4 C or IDE con'trs	5.95	
<b>Cables: I/F, CDROM, Floppy Power Splitters-Tower Systems</b>			
CABPW-1W-1F	Power converter cab HD-M -> FD-F	4.95	
CABPW-2W-1H1F	HD/FD power splitter HD-M->1xHD-F/1xFD-F	6.95	
CABPW-2W-2F	FDD power splitter 4p-M->2x 4p-F 15cm	6.95	
CABPW-2W-2H	HD/CD power splitter 4p-M->2x 4p-F 15cm	6.95	
CABPW-3W-1H1F	HD/FD power splitter HD-M->2xHD-F/1xFD-F	8.95	
CABPW-3W-3H	HD power splitter HD-M-> 3xHD-F	8.95	
CABPW-HD-PWXTN	4p-M -> 4p-F HD/CD power cab ext 90cm	9.95	
CAB-HD-FD/A	23p-M-floppy -> 4p-F HD/CD power 90cm	9.95

# Screen PLAY

The latest games reviewed, previews and our definitive hints section.

## AF'S REVIEW POLICY

### WHAT OUR REVIEW SCORES MEAN

Every month we scour the world's software houses for the latest and greatest Amiga games. We try to ensure we keep you as up to date as possible and we'll stop at nothing to bring you the best, definitive, no-nonsense reviews of the games that matter.

- 90+%** The crème de la crème. Only the very best, most playable and original games are awarded an AF Gold – the most highly prized rating there is.
- 80-89%** These are excellent games that could be improved ever so slightly. They are well worth your cash.
- 70-79%** A very good game with a few flaws. Games that get a score in this range are still good, but need work.
- 60-69%** Above average products which need improvement to get a better score.
- 50-59%** Average products get average reviews.
- 40-49%** Below average and needs a fair bit of work to make it worthwhile.
- Under 40%** The absolute pits.

Look at the goodies heading your way soon.

**G**reetings! There's something a bit strange about the way things happen here at *Amiga Format*. Usually, the new boy gets all the rotten jobs to do, but writing Screenplay is right up my street. Not only do I get to play games, but I also get the chance to express my opinion, which are two of my favourite occupations. So I've been beavering away to give you all the information you need to make purchasing decisions about the latest games. It's a risky business, though. I've been pulling my hair out trying to get that bit further in *Wasted Dreams*, and my predilection for making small green sprites jump all over the place is going to have me seeking counselling for frog addiction soon. Luckily for me, Ben has seen the warning signs of my impending breakdown and has kindly volunteered to review *T-Zerø*. It's been a good month for game releases, with some good quality titles up for review. And it doesn't stop there – our previews section takes a peek at *Worms Armageddon*, *Foundation's Edge*, *Nightlong* and *Land of Genesis*. What's more, next issue we'll be reviewing *Imperator* and *The Gremlin Collection*.

Paul Cavanagh

Weave, dodge, but most importantly shoot 'em up!

# Previews

What's coming up? **Paul Cavanagh** looks at the games you'll be itching to buy soon.

# Nightlong

Don't the graphics look superb? And there's over eighty locations for your visual delight.

**O**riginally released on the PC by Team 17, clickBOOM are now working on the Amiga release of this slick point and click adventure. There's a futuristic storyline filled with old chestnuts (multinationals take over the Earth blah blah massive corruption blah blah private dick investigates), but that's not the important thing. As you can see by the screenshots, it looks stunning with 16-bit graphics throughout. The

game will boast over 80 locations, as well as loads of speech and in-game movies. There will be two versions – English and German, both coming on 3 CDs. Details on release dates and machine specs are very sketchy at the moment, but with those graphics you can expect to need a graphics card, and clickBOOM are hoping to have the game out by the end of the year.

clickBOOM's **Nightlong** will boast over **80 locations** as well as loads of speech and in-game movies.

It would be a real surprise if you could get these sort of visuals without a graphics card

# Worms Armageddon

**A**t last! With *Worms* having originated on the Amiga and then being ported to just about every other platform out there, it's about time we got an Amiga version of *Worms Armageddon*. Hyperion have acquired the license to develop the game and will be shipping it for both classic ('060 and PPC/WarpOS, although an AGA version is under review) and NG Amigas. There are no firm release dates as yet, but expect something to be happening by the end of the year.

Playing with your Worms? That's a bit fruity..

Why is the future always so dark and eerie?

# Foundation updates on the way

There are two new Foundation projects currently in production.

The first, which should be available from Epic Marketing by the time you read this is *Foundation Director's Cut*, which is essentially the same game as *Foundation*, but with graphics card support, better computer AI, more in-game options and a lot more. Next up will be the sequel, *Foundation's Edge* which will feature more varied landscapes, all new levels, multiplayer games for up to eight teams, new

sound and music, new in-game GUI design and more. *Foundation's Edge* should be around sometime later in the year.

## Foundation's Edge

Foundation fans can look forward to an updated version as well as a whole new game.

# Minimum Safe Distance

Don't be too hasty in judging *Minimum Safe Distance* from this screenshot. Satanic Dreams are keen to point out that it's very

early days for the game, and are positive that the game will not only have great gameplay, but will look great too. Basically, *MSD* looks as

though it's going to be Worms in real-time with the option to play two player split-screen, via serial or null-modem. Players can choose to help each other or blow each other into little bits with over forty weapons. Sounds fun. There's no release date as yet, though.

# Land of Genesis

Hurrah for *Turrican* style games! I love 'em. So I'll be looking forward to getting my paws on *Land of Genesis* when it comes out in October. This is one of those games that got underway before being shelved. Now it's been taken up by Darkage Software, so we should be able to run about shooting everything in sight fairly soon.

Combining platform and shoot 'em up action, *Land of Genesis* looks like a bit of a giggle.

# T-zero

Ben Vost gets back to the old skool, boyz, with this dope shoot-'em-up.

These futuristic structures. What are all for? Blowing up spaceships, of course.

Ah, them were the days, queuing up to get a go on R-Type, pushing past the big boys who smoked Rothmans and sported love bites. Actually I'm a bit too old to have been doing that, but swap R-Type for Scramble and you get the idea. The upshot is that shoot-'em-ups were my first arcade love, and they remain to this day a great source of amusement and irritation in equal quantities. I actually bought a copy of R-Type Delta for my PlayStation – it was great, but

kind of souped-up-Tempest kind of way, but I'm not interested in those games. Give me a home where numerous baddies roam and the scenery scrolls by all the day and I'm a happy bunny. Better yet, if there are numerous power-ups to be had and occasions when there's so much going on on the screen you can't see what's happening and have to rely on the Force to guide you – that's my kind of game. In fact, that's T-zero.

One of the best things about this game is that, unlike earlier shoot-em-ups on the Amiga like X-Out, ProjectX or the like, there are moments when there are just far too many things flying around the screen – with no slowdown! This also means that because this is possible, the authors do

There are numerous power-ups to be had and occasions when there's so much going on on the screen.

over too quickly, so I needed a new source of blast power. The new consoles and the PC just aren't very good at this sort of game, in the main. They want to add spurious 3D objects in (mainly because it's hard to scroll smoothly), or convert the whole thing to polygons and 3D in a

(above) You'll need the manual to enter copy protection codes in order to play the game.

## Only Amiga makes it possible

People have moaned that they won't buy a game these days unless it'll work on their expensive graphics card, and, in the main, I agree with them. However, you just couldn't do this kind of a game on an Amiga graphics card – at least not without some serious horsepower behind it, and we're not just talking about a mid-range 603e here. Actually the fact you can do it on an Amiga at all, especially an 030 machine is quite impressive. Previous titles of this kind have always had a slow-down when too much stuff was on the screen and also limited the amount of objects flying around.

## Incidentals

You know how console magazines always go on about the intro for a game – something you'll probably only ever look at once – well, our turn now. The intro for T-zero is very nice indeed, although it's a bit dark, and the soundtrack to accompany the game is suitably block-rocking or hi-energy, depending on which sort you choose.

It's all very pretty, but you sometimes wonder what exactly is going on.

Game over, man, game over! A scrolling field of graves. Cheerful.

it, making the game very hard for beginner players. Even so, after a few goes you should be getting used to the organic way baddies appear instead of regimented waves that can be learned, and deaths are more often caused by foolish jiggling of the ship at the wrong time than by taking a bullet in the gob.

One of the differences between T-zero and other blasters is the fact that you need to be more discerning

(left) Avoid those skulls. They invert your controls. The little swines.

(Above) It's easy to smash into the scenery if you try to get all the pickups

Never a dull moment. There's always plenty happening on screen, with no slow-down.

## Ship-shape

There are three spaceships to choose between when you accept the mission to wipe out the bad guys, and in traditional shoot-'em-up fashion, they all have their own attributes and problems. The manual talks of an extra ship to be found, but we haven't got it yet.

The Mantar 2 is a good all rounder, with average weapons and speed.

The Suzer 4 is small and nippy, but lacks plasma front weapons.

The Gordan Maj - a big blaster. Slow and cumbersome, but packs a punch.

At the end of each level you are awarded bonus points for pickups

about just which power-ups you pick up - leaping about the place collecting everything will not only get rid of the guns you'd built up and built up, but also give you a crappy laser that's back on power level one. There are also bonus items you can pick up, and in story mode the number you retrieve determines which path you'll take through the game. The only bad thing about the power-ups is that you never get to the kind of gratuitous outrageousness that you got in *Gradius* or the like, with your weapons basically clearing all before you.

Nuke 'em! Them there nukes are pretty effective. And so they should be

In fact, there are very few areas we could complain about *T-zerØ* on. The whole game saving thing is a bit weird to work out, and the pixel perfect positioning of your craft to escape the hail of bullets is sometimes unforgiving, but then, that might be our shoddy joysticks. It's also hard to keep the power-ups you like since they often get dumped one on the other, meaning that it's hard to separate those homing missiles from that front-firing plasma you didn't want, but at least your default weapon is powerful enough so that you don't feel like giving up if you've lost a life at the end of a level.

The single best bit for me has to be the extras. The CD track listing hints at extra secret levels; there are several ways to play the game (arcade or story, easy or hard and more), and, as we said before, there is at least one extra ship to be gained. In addition to all

A powered up hero kicks some alien butt.

All the classic weapons are available - guns, plasma and secondary weapons.

A two player game in full swing. He's mine! Mine! Leave him to me.

this in-game excellence you can even design levels of your own with the included (*Blitz Basic*-based) level designer, although you're limited to the graphics and backgrounds they use.

In short, this is a great game. It may not be revolutionary, it might not run on graphics cards, but it is absolutely chockful of addictive elements and great fun. Our recommendation? Buy it immediately.

## And now the bad news...

A few things are wrong with *T-zerØ*. One is the save game system, which is practically unfathomable. Another is the fact that because the Amiga only has four channels of sound, the sound of your guns firing blanks out when Sofia says you've picked up a new weapon (and at other times). Using AH! would have resolved this, but probably would have slowed down the game too much. Another cack thing is the groping for the keyboard when you want to use a smart bomb - why not add support for two button joysticks like the CD<sup>32</sup>? Other than those minor niggles there isn't much wrong with the game, which is why we put these bad bits in a box where you might not even see them...

## Geek stuff

The technical specs for *T-zerØ* are pretty modest, compared with clickBOOM's other games. On the box it reckons you need a 25MHz 030 with 8MB RAM free, but we coped with our crappy office 1200 that only had 6MB all told, however, it was no go (and not very informative as to why not) on my A4000 with a CyberStorm MkIII 060 in it, although it did run on Rich's A4000 with CyberStormPPC card. To be really honest, I didn't spend an age trying to get it to work on my A4000 - I wanted to play the game itself too much!

## Pros and Cons

- Super-addictive
- groovy graphics
- excellent sound
- Some awkward controls

OVERALL VERDICT: Fantastic! Get it now

# 93%

# Wasted Dreams

Paul Cavanagh explores a hostile planet, picks things up, gets into fights and has a bit of a tantrum when he can't get very far.

What interesting goodies can be found in this cave?

The superb animated intro to *Wasted Dreams* paints a grim picture of our society in the near future. With the World's population grown to unsustainable levels, criminals begin to get the upper hand, and lives are ruled by fear. Life on Earth becomes so intolerable that a mission to locate and colonise a new planet is established. After two years

(left) Here's a bar in the Military Complex. Check out the icon of the lips, indicating that you can speak to someone.

“ The principles of playing *Wasted Dreams* are simple, basically you roam about talking to people ”

in space, a planet is located, and colonisation begins. Things go well and before long the ship is on its way back to Earth bearing the good news, so that a mass evacuation of the homeworld can begin. Just as the ship is about to leave orbit, she is attacked and destroyed, with only a single escape pod surviving the blast.

Unsurprisingly, when you start the playing the game, you control the survivor or survivors of the attack. The game allows for two people playing simultaneously, but if you choose the single player option, the first thing you see is the other character dying.

The principles of playing *Wasted Dreams* are simple, basically you roam about exploring, talking to people and trying to stay alive. Surviving is actually pretty difficult – it's not just the indigenous population that are itching to get in a fight with you, the

Here we see a giant plasma weapon being discharged. Now why would the colonists want such a big gun?

colonists are happy to have a go too. The enemies are always armed with laser guns, and they're generally pretty good shots. You need to progress a long way into the game before you discover somewhere to recharge your shields, and up until that point the game can be frustratingly difficult.

Interacting with the environment and characters is made simple with a clever little control system. Beneath the main playing area, there's a little window that shows animated icons if you can interact with anything or anyone that you are standing next to. The icons are designed to be easy to understand, for example if you are able to speak to someone, the icon shows a mouth opening and closing. Below the icon there is an inventory, and you can highlight different items by holding down Alt and pressing left or right on the joystick. This can be an awkward little manoeuvre, and it irritates me that you have to hold the Alt button down – it would have been easier to press and release Alt, move your joystick and then press fire to select an item. It's only a little thing, but these things all add up.

## Wasted Dreams - The Story

The Earth has become all dark and spooky, and there's nastiness everywhere. So an exploration group set off to find somewhere else to live.

They find a new planet, and begin the colonisation program. Before long they've got it all ticking along nicely...

...So they launch a ship back home to Earth, so that the rest of the population can enjoy this new paradise.

Is it just me, or does this really, really look like The Chaos Engine?

Talking to other characters can be fun. There's a lot of dialogue in *Wasted Dreams*, which pulls you into the game with the characters' dialogue helping to develop the plot and give you hints. The non-playing characters speak in a multitude of different accents, which can occasionally give you the giggles. The voice acting isn't brilliant, in fact it's down-right cheesy in places – there's an Australian engineer who all but says 'strewth cobber!', a mining technician whose Ulster accent borders on the ridiculous, and a good number of characters who seem to have been to the Biggles school of diction. I'm not sure that it's supposed to be funny, but the silly voices are one of the best things about the game.

Visually, the game is nothing special. The graphics are clear and well drawn, the animation adequate. There's nothing here that's going to make you sit up stare, and the graphics are hardly original. The top down perspective along with the way that trees and bubbling mud pools are depicted are distinctly reminiscent of *The Chaos Engine*, while the character animation and

What a shame there's all this hassle going on. It's such a pretty planet, with waterfalls and everything.

the 'collect items in order to progress' gameplay isn't a million miles away from *Prince of Persia* or *Flashback*. Even the sound effects of jungle noise reminds me of *Cannon Fodder*. However, despite the fact that so much of the game seems to have been borrowed from elsewhere, *Wasted Dreams* does manage to retain a sense of originality. There is a strong storyline here, and the gameplay, whilst not groundbreaking, is applied in such a way as to seem original.

Initially, the game is very appealing. It doesn't take long before the plot develops, leaving you with more and more questions to answer. Meeting new characters reveals a little more of what is going

## Fun With a Friend

If you team up with a friend you can gang up on the bad guys, which means that you both last longer. The game's easier in two player mode, so if you've got mates, get them to play the game with you.

You can choose whether or not your shots hurt your playing partner. Be warned though, accidentally hitting your friends can result in nasty face-offs.

(left) You'll be happy when you reach this part of the game. It's a machine that recharges your shields. Phew!

There's a really tricky mazy bit in the game, but if you press 'm' you call up one of these groovy maps.

on, which makes the story all the more intriguing. To begin with, the fights are fun. But play the game for a while longer and things begin to get a bit tedious. You start to avoid getting in a fight because your energy levels start to deplete rapidly, you get stuck and spend ages wandering around the same locations, trying to figure things out, and when you do progress you don't feel suitably rewarded. The game can get fairly repetitive, it's easy to imagine that if you can just get through that door, you'll be welcomed by a whole new area with new and interesting environments and characters. But make it through the door and it's just more of the same. This isn't an easy game, although a few of the puzzles are very obvious, most problems take ages to solve. It's good to have a challenge, but with this game there's nothing interesting you can do if you reach an impasse. *Wasted Dreams* is far too linear in its approach to game progression; it would have been more interesting to have had a good few puzzles to solve at any one time, what you get is one or two challenges that must be cracked otherwise there's nowhere to go. It's a shame, because there are so many appealing features here, the plot is really interesting, and I really want to get on and find out what's going on, but if you can't progress the game just gets tiresome.

DEVELOPED BY: Digital Dreams Entertainment

[www.dd-ent.com](http://www.dd-ent.com)

PRICE: £27.99

## Pros and Cons

- An intriguing, involving plot.
- There's lots to do.
- Funny voices.
- It can be difficult to progress sometimes.

**OVERALL VERDICT:**  
This is a great game - if you've got the patience for it. It's frustrating, but very involving.

**72%**

but before the ship can leave orbit, it's attacked.

Leaving just two survivors to figure out what's going on.

# Superfrog

Isn't he simply wonderful?

Paul Cavanagh relives the glory days of classic 2D platform games as he joins Superfrog for some frantic amphibian antics.

Ta-daaa! Superfrog sets off on his mission. As depicted by Eric Schwarz.

The introductory Eric Schwarz animation is funny, cute and screams

Superfrog himself is a versatile little character. He can jump with a level of dexterity I've never seen in a frog.

A clown tries out crunchy frog surprise. Yum.

Battle through five worlds of platform action and be rewarded with Project F, this lovely froggy shoot 'em up.

quality at you, reflecting the content of the entire game. With sharp, colourful, cutesy, cartoony visuals and a soundtrack that's fun while somehow contriving to not irritate, this game really is a must for any self-respecting Amiga owner. Unless you completely hate all platform games, that is.

The plot is as cheesy as they come, with a prince being turned into a frog by a witch who has abducted his beautiful wife to be. Fortunately for the lovelorn amphibian, he comes across a bottle of Lucozade which magically transforms him into Superfrog, giving him the powers to chase after the wicked witch and rescue his betrothed.

The gameplay is all very standard

platform fare. You know the score: leap about collecting coins, power-ups and goodies, whilst avoiding or splatting the bad guys (there's all sorts – bats, bees, hedgehogs, tortoises – it's all fairly clichéd, but I've got a feeling that Team 17 knew that, and were conscious of making *Superfrog* a classic platformer with all the classic elements). If you come a cropper you lose energy which can be replenished by drinking Lucozade (a universally popular drink in computer game land, it's not only Lara Croft who likes it). The exception to this rule is when Superfrog falls on spikes or gets burnt by fire, in which case he loses a life instantly. Which makes for some challenging gameplay in later levels, where spikes are spread liberally around the maps, usually at the bottom of steep, slippery hills. The game action is pretty pacy, but not so fast that you feel as though you can't control it.

Superfrog himself is a versatile little character. Without any powerups he can run and jump with a level of dexterity I've never seen in a frog (it's good stuff that Lucozade). If he comes across a pair of wings he can flap his little arms about and stay in the air for a bit longer, giving him access to those harder-to-reach platforms. He can also pick up Destructo-Spud, a little creature that he can throw at enemies. The Spud won't dispose of every bad guy, but is very handy to have about. Both of these bonus items stay with Superfrog until he loses a life. Other bits and pieces worth looking out for are speed up icons, which have an obvious effect and last until Superfrog picks up a slow down icon. There are also restart icons liberally

Nice friendly trees. And horrid stingy bees. dotted around the levels.

With five different game worlds, 25 levels and subgames there's enough here to keep you interested. It's a bit annoying that nothing's been added to the game, but if it ain't broke, why fix it?

Way back in *AF* Issue 47 *Superfrog* was awarded 85%, failing to score more due to its lack of originality (given that there was a plethora of platformers about at the time, it's hardly surprising). I've always loved platformers, and *Superfrog* has got to be one of the best ever. So based on the fact it's such a hard game to put down and that the game now only costs £14.99, (compared to £26.99 in 1993), I'm awarding it an *Amiga Format Gold*. Go buy it.

AVAILABLE FROM: Isiona Entertainment

# GAMEBUSTERS!

## Sixth Sense Investigations

FULL

**SOLUTION**

Chat about Elvis's ghost and liaise with disguised robots in the final part of our walkthrough. *Mark Wheatley is your guide.*

**PART 3**

Beware of shoddy puns after you blow your way into the bank.

Go to the city and then to the park. Talk to the warden and give him the letter. Then talk to him about his spiritual experience and when he tells you about his experience with Elvis's ghost, give him the sunglasses. Now return to the police station in the city.

You'll have to do a lot of talking to Shirley and Pokey here, and you have to convince Shirley that Mayor Clintwood loves her. This basically

involves talking to one character, then the other, then back again. To talk to Shirley the first time, ring the bell on the desk to get her attention. Once she's

convinced, take the scissors from her desk and use them on the keys attached to the now sleeping Pokey's belt. Talk to Brad and say you've come from Mr. Peanuts. Ask if he has the record, then repeat that you really need it. Use the keys with the cell door, then open it. To free Brad, take the police uniform that's hanging up, which he'll use to disguise himself.

The scene cuts to Brad explaining that he needs some clockwork, so return to the police station and try to open the wall clock. It'll fall down, so take it, return to Market Street and go to the bank. Brad will blow a way in, so enter the bank.

In front of the safe, take the rubble. You'll have to do this a few times before you uncover the safe-wheel. Use this with the safe and then open it. Take the key that's

Plug the fountain and meet up with a ghost and a robot. Obvious, really.

inside and use it with the drawer on the far right of the room. Open the drawer and take the record that's inside.

### Leaving Toon World

Return to Market Street and go to the city. Go into the Toon's Club by using the bell again. Go to the far right of the room and take the bottle, plus the cork. Now give the record to Mr. Peanuts. He'll then call Frick the Fox over. Talk to him until you find out about Sally, who has

Break into the bank and find the record for Mr. Peanuts in the drawer (left).

Once you've talked to Arthur (right), you're almost ready to leave this dimension.

66 You have to convince Shirley that **Mayor Clintwood loves her**. This involves talking to one character, then the other. 99

Lots of buttons to push, but you've nearly completed the game now.

on the machine with the tape spool.

Go to the map computer, on the rear wall on the right hand side of the room, and examine the monitor. You'll discover the code you need, which is 4273. Go to the main computer in the centre of the room and enter the code by using the fourth button, then the second, etc. Make sure you get the code right first time!

### The End

Now push the big button just to the right and return to Walk Street (use the door controls to open the exit door). Give the Robopoly map to Bernie and say you want to go to Sixth Sense Investigations offices. Now all you have to do is chat to Arthur,

The end of the game, and everyone is reunited. Aww.

Once back in Robopoly, Sally the robot can be a great help.

Ben is banished by the robot Emperor. Try to leave and Arthur will appear, explaining what you need to do next.

Leave the club and wander off to the park. Press the red button in the warden's shed to open the gates, then enter. Use the cork with the fountain to stop the water flowing, then return to the Toon's Club and tell Arthur that everything is ready. The scene cuts to the park, where you give Sally the console.

### I have a plan...

The scene will now cut back to Ben in Robopoly, where he hatches a cunning plan with Sally to overthrow the Emperor. You'll need to talk to the soldier about the quadrophone teleport, and you'll end up being thrown in jail as asking about the teleport is illegal. Give the console to Ralph who says he'll help you out.

Use the old knife with the ventilation grill trick and escape to Walk Street. Give the Robopoly map to Bernie and say you want to go to the Computer Centre, where you have to switch off the other systems to redirect power to the computer.

First, use the switch at the top right of the room, near the display of coloured dots on the wall. Now use the lever on the right of the location, with some colour lamps nearby, three times. Walk to the left hand side of the room and use the lever on the back wall, below the red rectangle. Finally, use the switch on the far left,

who appears, and then finally use the platform on the right. The scene will then cut to Frank, back on Earth, and congratulations – you've finished the game! All will then be explained, but I won't spoil the ending here. You'll have to play it all through for yourselves...

“ All will be explained, but I won't spoil the ending here. You'll have to play it all through for yourselves... ”

Once you've fiddled with all the computers, sit back and watch what happens to the Emperor (above).

The code you need (left) and the escape from Robopoly (above).

Going back to the Sixth Sense offices takes a while in Robopoly...

SEND US YOUR TIPS!

Helping Hands

If you've got some hints, cheats, tips or general good advice on any Amiga games – especially some of the newer ones like Napalm, Hexen, Heretic and Quake,

Also, if you've got a query about a game (and no, we don't really mind people asking about The Secret of Monkey Island,) then drop us a line and we might be able to answer it in Helping Hands.

**Richard Drummond** gives you the low-down on what's new and interesting in the Amiga freeware and shareware scene.

## MysticView 1.0

I'm the boss, not the computer. So when I wish to view a picture file, I want it displayed the way I want. Many viewers determine the screenmode that a picture should be displayed in from information stored in its file. Typically for ILBM files this means you get the same screen mode as the picture was created in. This is all very well, but what about if some modes don't work on your setup. For example, I don't have a video monitor or scan doubler so cannot view PAL or NTSC screens.

*MysticView* puts the user back in charge. It is a picture viewer which allows you to configure exactly how images are displayed. Images are rendered in a standard intuition window on the screen of your choice. If this screen is short on colours, the image can be dithered, colours re-mapped. If the window is too small, the picture can be scaled to fit (taking the screen's aspect ratio into account) or scrolled. It also supports multiple zoom levels. The scaling and dithering performed by *MysticView* creates significant demands on processor power. An 040 is a realistic minimum. A graphics card is also a must to get the most from this package.

*MysticView* does all its image loading via the standard datatypes. This is a flexible approach since it is easily expandable: coping with a new format is just a question of installing the relevant datatype; and the PPC is supported with a PPC datatype. The disadvantage is that progressive decoding of images (eg, JPEGs and PNGs) is not supported.

*MysticView* can handle lists of pictures and can show them either one-by-one in a slideshow or as a looped animation. The preloading and caching of images is supported. This latest update has some neat

Take control of picture viewing with *MysticView*.

new features as well. There is a new optional toolbar with slideshow and aspect ratio controls; the menu layout has been reorganized to make the locating of functions easier;

and there is a new picture-in-picture function.

This current release of *MysticView* is great: it achieves the correct balance between power and ease of use. If many more features were added there would be a danger of overloading. Having said that, an ARexx port would be a valuable addition as the program currently lacks one.

## NewsCoaster 1.1

For some reason the Amiga has not been catered for so well in the area of news readers as it has been in other types of Internet software. *NewsRog* and *Thor* are two of the most powerful news clients on any platform, but both are rather difficult for the beginner to get to grips with. *NewsCoaster* attempts to fill the middle ground, combining ease-of-use with some more advanced features.

*NewsCoaster* is an off-line news reader only. This means it can only batch download complete Usenet posting from a newsgroup. In contrast an on-line reader allows you to scan the headers of all the messages in a group and download only the ones you are interested in reading. An off-line reader will generally require you to be logged in to the net for a shorter period and hence mean lower phone costs.

The user interface for *NewsCoaster* is straightforward. It is realized with MUI and the main window consists of two lists: a list of groups that you are subscribed to and a list of messages in the selected group with a balance bar between the two. The GUI is well-designed and configuration is particularly easy.

The cost for this simplicity is lack of power. For example, you cannot download messages from individual groups: the Fetch News command gets messages from all subscribed groups. *NewsCoaster* does feature a degree of multi-threading. You can carry on reading

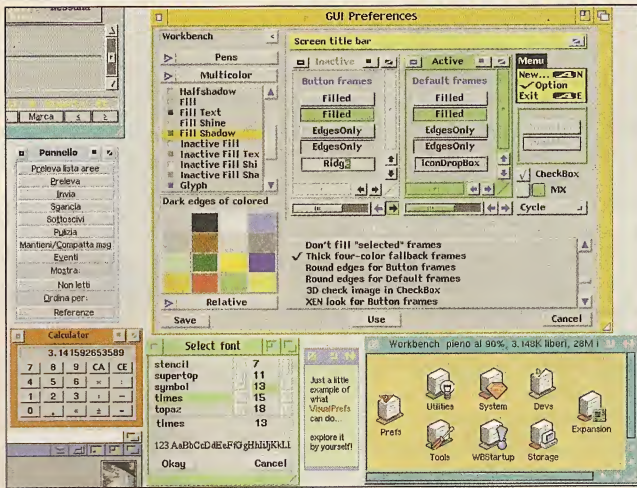

*NewsCoaster* is a capable news client.

## VisualPrefs 1.5a

One of the nice things – in fact probably the only nice thing – about the X Window GUI system is the degree to which it can be customized to suit personal taste. In contrast, Amiga's Intuition system is by default nowhere near so configurable. But Amiga users are not ones to let default behaviour stand in their way. Over the last few years scores of utilities and hacks have appeared which allow you to tweak different aspects of the Amiga's graphical interface.

VisualPrefs is a tool which allows you to take total control over the visual aspects of intuition objects. It permits the modification of all system gadgets and standard GadTools gadgets. You can select the gadget images, the rendering pens, frame types, etc. The package is supplied with sets of alternate gadget images for you to try and even supports the loading of bitmaps so that you can design your own.

The package consists of two main parts: the VisualPrefs hack itself which must be called from your startup-sequence and a Prefs editor. It's more than likely that many of the functions that VisualPrefs performs will be duplicated by other tools that you may have

Give your desktop a facelift with VisualPrefs.

installed like *MagicFrames*, *SyslHack* and *CycleToMenu*. These should be disabled first. Likewise, if any you have any of these or similar functions enabled within MCP, you should turn them off.

VisualPrefs is a powerful system and neatly combines the functionality of many different tools. However, I found the Prefs editor a real pain to use: it requires too much trial and error to achieve the effects that you want. Also VisualPrefs's GadTools capability achieves rather ugly results. The NewGadTools function in MCP is much better.

 FROM AMINET: [util/awb/VisualPrefs.lha](http://util/awb/VisualPrefs.lha)

There's more heat than light in c.s.a.misc.

messages in a group while downloading new posts, but the new posts will not be available until the download is complete. A status bar appears while fetching messages but only shows the current message number, not the transfer rate.

The messages themselves are displayed in a separate window. The rendering of text in this window is particularly slow for some reason. NewsCoaster supports attachments to posts and can handle the usual colour and style highlighting that mail packages perform.

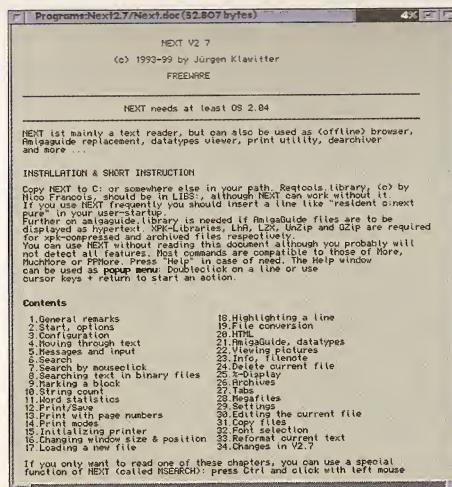

NewsCoaster is an ideal news reader for the usenet novice. It will not appeal to users of Thor or NewsRog, but, to be fair, these are both more mature packages. Given another six months' development NewsCoaster could become quite accomplished.

## Next 2.7

Next is basically a text viewer. However, it is more than that, because it can recognize and display (albeit imperfectly) AmigaGuide, HTML, RTF, MS Word, DOS and Mac formatted files. It also handles pictures files via the standard datatypes system.

The main window of Next shows the current file and supports ANSI formatting and style codes. A scroll bar is situated horizontally at the bottom of this window. This, oddly enough,

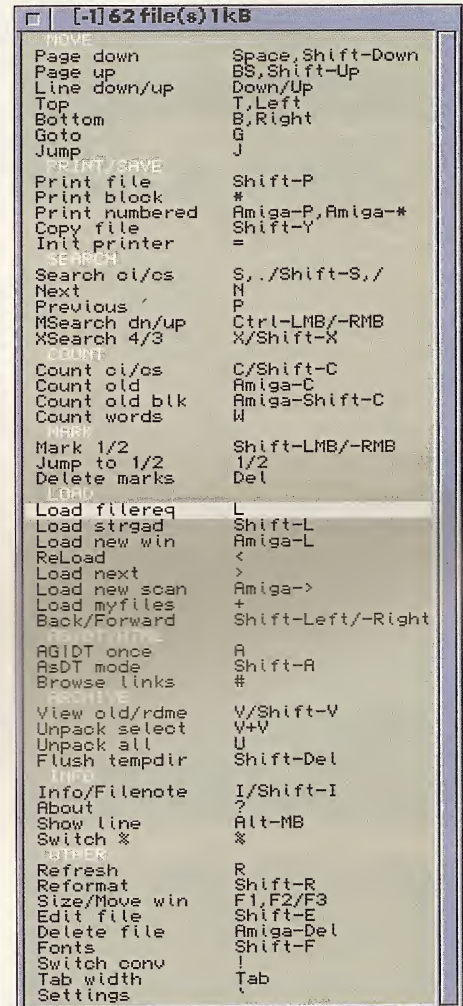

allows vertical scrolling through a document, but is counter-intuitive. The update speed of the window lags behind the scroll gadget making exact positioning within a file difficult.

If a hypertext document is being shown, such as a guide or HTML file, links are highlighted and may be clicked to navigate through the document. Image links can be followed, but images are displayed on a separate screen. I could not get this aspect of the program to function at all. Perhaps Next cannot cope with the chunky bitmaps that my CyberGraphX screens use. In any event it does not allow you to select the screenmode for displaying images in.

Next has no standard menus. Instead right-clicking pops up a window with a list of commands which are selected by the mouse. The program boasts some powerful features, such as text-marking, word-counting, searching and printing.

I found Next awkward to use. It tries to be all things to all people. Next performs far too many functions and none of those well enough. It is reassuring, though, to have a viewer which will attempt to display just about any document type you throw at it.

Next has more functions than a Swiss Army Knife.

## ONLINE UPDATE

The Aminet mirror located at Imperial College's SunSite in the UK has been down for the last few weeks. Rumour has it that the site was cracked and all the back up files were corrupted; hence the site required complete reconstruction. At the time of writing they have a limited FTP service in operation and the log-on message informs you that a major hardware and software upgrade is being performed – no mention of a security breach. Until full operation is regained, British Amigans are probably best off using the Aminet mirror at Paderborn, Germany. And, no, you don't need to be able to speak German to use this site.

In AF126 I had a look at and enthused over *FACTS*, a handy little tool that ensures that your Amiga's clock is always set to the correct time and timezone while your machine is hooked up to the Internet. Previous versions lacked localization – a bit of an anomaly for a program that purports to localize your system. Version 2.8 corrects this oversight and ships with English and French translations. Get a copy from the Aminet at [comm/tcp/facts.lha](http://comm/tcp/facts.lha).

## Flamingo V1.06

Emulation is a popular pursuit on the Amiga. Given the appropriate software, an Amiga can pretend to be anything from a ZX Spectrum to a PC to an N64. Commodore's old 8-bit series of computers are particularly popular targets for emulation, especially the C64. Even the Plus/4, a computer that never really emerged from under the 64's shadow, has several emulators on the Amiga. Quite why, in this day and age, anybody would still want to run Plus/4 software is beyond me, but since the Plus/4's graphic hardware is less expensive to emulate (it does not support

Get into retro gaming with *Flamingo*.

The first computer games were all inspired by role playing games such as *Dungeons and Dragons*. Maybe this is simply because the same geek mindset is required for playing RPGs as is for programming computers, who knows? Perhaps the most famous of these pioneering games was *Adventure*, the program which launched a thousand text adventures. Another was *Rogue*. *Rogue* was more obviously RPG based in that you played a character with the usual attributes like strength, dexterity and charisma and featured rule-based combat and magic systems. It presented you with an overhead 'graphical' view of the game world – a map constructed from simple text characters – which you could move around in and interact with. *Rogue* also inspired many clones, including the famous *Ultima* series and others such as *Hack*, *Larn* and *Moria*.

*Angband* is another single player role playing game in the tradition of *Rogue*. The aim is similar: to fight and explore your way through the 100 dungeon levels and ultimately kill Morgoth, the Lord of Darkness. It features the same graphical perspective as *Rogue* but, on machines with bitmap capability such as the Amiga, the text-only icons of the original are replaced by more easily discernible bitmap icons. The rules of the *Angband* world and more advanced, too. The monsters that you meet are intelligent: they can sleep, open doors, and run away.

In today's world of texture-mapped 3D graphics, *Angband* may seem woefully crude. But the fact is that this genre of game has evolved and has been continually played for twenty years. The fundamentals of the gameplay are simple and yet there is something terribly enticing about it. It's the sort of game that you can load up and play and then suddenly realize it is 4 o'clock in the morning.

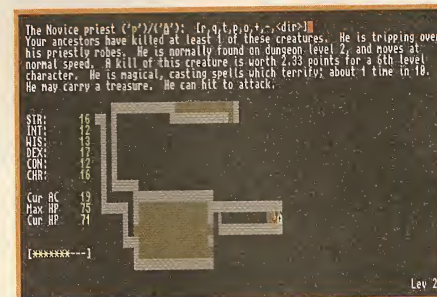

The only fault I can find in this Amiga version of *Angband* is that it does not take full advantage of current machines. The PC version of the game has much larger, more colourful graphics which could easily be used on the Amiga. It also does not allow you to select a

hardware sprites) Plus/4 emulation at least has the advantage of being faster than 64 emulation. The games do tend to be cruder, though.

*Flamingo* is a new Plus4 emulator. It is not yet complete, most notably not supporting the .D64 disk image format, but is quite usable. The sound emulation is still a bit ropey, too. *Flamingo* will run in any screenmode as long as a suitable plug-in driver is available. CyberGraphX screens are recommended if you have a ZorroIII graphics card. However, respectable screen refresh rates are achievable in AGA with the supplied PPC chunky-to-planar plug-in. It will quite happily churn out the 50 or 60 fps of the original machine.

The emulator requires a suitably-patched Plus/4 ROM image to work. Luckily the supplied docs tell you where and how to obtain these from the Internet. This is of dubious legality, but at least avoids the hassle of having to link up your Plus/4 to an Amiga. *Flamingo* will not work

## Angband 2.8.3h

Twenty years on, *Angband* proves that the *Rogue* genre is still going strong.

screenmode for the game to play in. PAL is the default, but you can coerce this with a mode promotion tool.

Nevertheless, download a copy, turn the lights down low, and get monster bashing. And if you fancy a harder challenge, try *Zangband*: [game/role/zangband.lha](http://game/role/zangband.lha).

# Serious

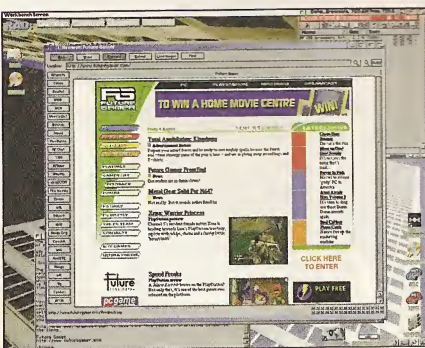

In-depth reviews of hardware and software that you can trust.

## AF'S REVIEW POLICY

...is very simple. **Amiga Format** is written by nearly all of the most experienced Amiga users in the world and what we say goes. OK?

### WHAT OUR REVIEW SCORES MEAN

- 90+%** These products are absolutely top notch. They are hard to find any fault with and that's the reason they get an **AF Gold** award.
- 80-89%** These are excellent products that could be improved ever so slightly. They are well worth your cash.
- 70-79%** A very good product with a few flaws. Items that get a score in this range are still good, but need work.
- 60-69%** Above average products which need improvement to get a better score.
- 50-59%** Average products get average reviews.
- 40-49%** Below average and needs a fair bit of work to make it worthwhile.
- Under 40%** The absolute pits.

What's new in the browser world? Everything! New versions of Voyager and iBrowse are about to hit our shelves.

Power's latest low-cost CD-ROM drive will hopefully convince those still clinging to their floppies.

**F**our score years and ten ago this great page was created. Now it is time to lay it to rest. Next issue sees a whole new concept in intro page management - we're going to ditch it. Fear not, however, you won't have to miss my salutary words greeting you and bringing you into the section we like to call "Serious". Next issue we'll just be revamping all the intro pages in order to give you more magazine to read.

Anyway, enough of next month, what about right now? With WoA just behind us there's always a plethora of new goodies to be reviewed, however, some of them take a little more reviewing than others, and so the Serious section looks a little thin this issue. We've had to carry over Tornado 3D again, since I'm not altogether happy with the way it works, and ImageFX 4 can't very well be reviewed in the same issue Kermit is discussing its development! Anyway, I hope that what's here will meet your approval, and just think how fat this part of the mag will be next issue...

Ben Vost

Simon wants his serial ports to go faster, so we gave him these for review.

Create your own demo, man.

In the last part of our WIP Kermit explains about IFX's new animation functions.

# Browser Preview!

You knew it was going to happen. Two issues after we do a comparison of browsers, the two most popular get an upgrade. Ben Vost previews them.

Sure enough, I ask Neil Bothwick to compare the current state of Amiga web browsers on the grounds that there probably wasn't going to be a new version of any of them for months, when not one, but two of the best-known browsers on the Amiga suddenly pop up in new versions. Now, the reason that this is a preview rather than a full-blown review of these boys is

down to the fact that they aren't finished yet – both are still early versions of what they will become. The reason for their release? I can only imagine that the allure of the World of Amiga show was so great that it prompted the release of these new versions. I'm also positive that by the time you read this, newer versions will have been released, so don't worry

overly about the decidedly beta feel to both browsers right now.

I've been using both for some time now, just visiting sites I would normally visit, to see how they'd compare. This isn't a harsh test of the browsers – I'm not trying to pull them apart – but I'm looking at the kind of performance I would expect in everyday use, visiting the sites I use.

## IBROWSE

**afb** <http://www.egroups.com/group/afb/>

The latest beta I have doesn't actually work as well as the version that was released at the WoA show, messing up table backgrounds, etc. However, iBrowse does work with coloured links (using a <FONT COLOR> tag inside an <A HREF> tag) which Voyager doesn't. The one major problem with both iBrowse betas right now is the fact that you can't change your font settings, and they are preset to tiny versions of Times – not nice.

iBrowse wins this round by displaying colour in the links.

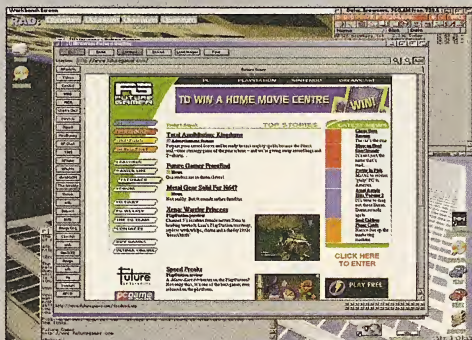

## VOYAGER

Voyager lays the site out well enough (and at least you can have the fonts you want!) but it's still slower than iBrowse at laying out tables. Another problem I've noticed is that sometimes pages that you've altered (such as settings for a particular member of the list) don't actually get updated when you hit the "Apply Changes" button. Actually they do, but to see the changes you have to hit Voyager's "Reload" button to get them.

## Future Gamer <http://www.futuregamer.com>

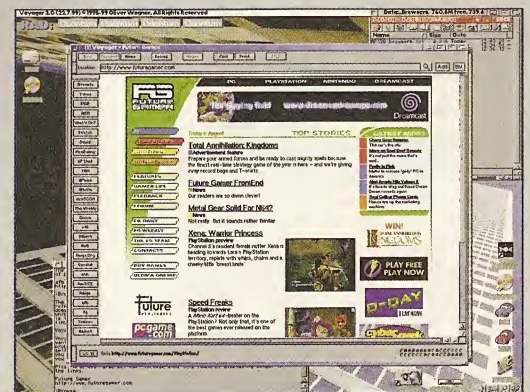

I didn't expect much from iBrowse based on this site's previous performance, but they've obviously edited their HTML. iBrowse's JavaScript implementation seems to cause more bother than Voyager's, and the first pre-release of iBrowse 2 didn't see the JavaScript at all (the buttons down the left side were static). However, all that's changed now and iBrowse displays the site nicely with moving buttons. However, the

"Latest News" bit down the right-hand side is oddly shaped, but it may be down to the fact you can't change iBrowse's fonts.

Future Gamer works nicely on both browsers.

Voyager didn't used to see this site at all – it would get stuck, issuing a "VBscript error", but now it works nicely as can be. The buttons down the

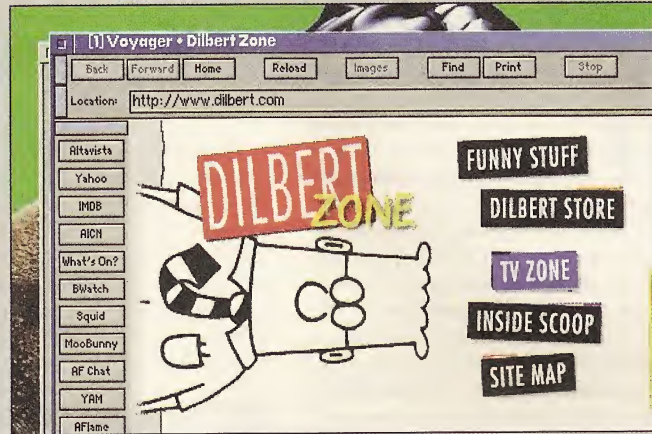

left animate, and the "Latest News" panel on the right is the correct shape and size. On other Future sites, such as the one for our mag (<http://www.amigaformat.co.uk>) the subscription form seems okay (I didn't test it), which can't be said of iBrowse.

## Dilbert <http://www.dilbert.com>

No Javascript errors, but then no moving buttons or anything. iBrowse copes better with the Quicktime movie page, but still can't play the movies, although it does open up an extra window. This usually crashes iBrowse fairly severely.

Voyager complains about Javascript problems when you go to the site, but then works fine. The buttons on the main screen are animated, but it can't open a fresh browser window to show the Quicktime movies.

While Voyager complains about the JavaScript on the site, iBrowse doesn't show the animating buttons.

## Czech Amiga News <http://www.realdreams.cz/Amiga/>

iBrowse wins. Much, much faster table layout than Voyager (still).

## The Onion <http://www.theonion.com/>

iBrowse wins. Again, table layout speed an issue, but in this instance also coloured links.

## Wirenet <http://www.wirenet.co.uk>

Voyager wins. iBrowse doesn't seem to work with as many Javascript-enabled websites as Voyager. Neil Bothwick's site is just one of many that has animated buttons which remain lifeless in iBrowse.

Voyager plays some Shockwave files, but the picture of Kyle here should be outlined in black and he should have a mouth.

you more space for extra links. However, iBrowse has a really neat feature with its URL prefs - you can turn features on or off for specific websites according to your wishes - very handy for those sites with background music, but it's a shame it doesn't allow you to enable or disable Javascript in the same way. EXTRAS: Voyager has a Shockwave plug-in, but it's very slow, doesn't do sound and doesn't handle outlined images very well right now. Both browsers have a documented plug-in structure, but there are no other external plug-ins for either at the moment.

### OVERALL

Both browsers are going on a storm, and there'll be adherents to both, just as there have always been. The other browsers, like AWeb or the vapourware AmozillaX, iProbe or Dry Ice aren't worth waiting for when these two will do most of what you need on the web. If pushed, I'd have to say that I think Voyager has the edge right now, but I'm sure the choice will be a lot more difficult to make by the time you read this.

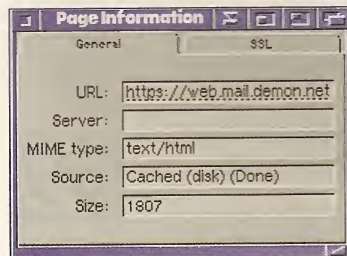

### OTHER FEATURES

**PRINTING:** Printing has long been a bugbear for Amiga browsers - the laughable attempts made at printing pages from any of the earlier versions are shamed by the effort put in by both these browsers. iBrowse has a very good print facility with PostScript, although there are still problems with scaling. iBrowse offers much better printing facilities through the preferences printer driver, but this doesn't seem to be working properly right now.

**USER INTERFACE:** It has to be said that Voyager wins hands down here. Although iBrowse has got the extremely nippy multiple-browsers-in-a-single-window feature, Voyager's ease of configuration has that feature beat, and the fact that you can now tear off toolbars from the main window to have them floating separately is a nice touch. Voyager also now highlights the tags in

the View Source page, and also allows you to update the page that's currently being viewed à la iBrowse.

**SPEED:** Both browsers are currently unoptimised, so neither goes as fast as they will, but iBrowse is still the leader in the speed stakes, when compared especially to Voyager's sluggish table

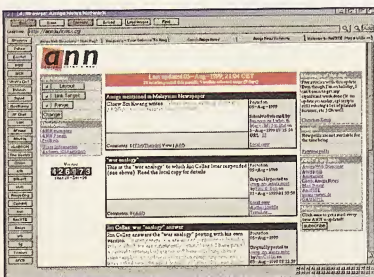

Voyager shows you all the info about a page, including its SSL cert (if you really want to know).

layout. However, they are both slouches for HTML layout when compared to Allan Odgaard's HTMLView demo, but that's offline only.

**SECURITY:** Voyager wins here with excellent information about sites, and certificates for SSL v2 and v3. I had no trouble browsing secure sites from within the firewall at Future - something that iBrowse has always given me trouble with.

**URLS:** Voyager has a very handy URL completer that means that if you type in a single word (like, say "volvo") it will take a guess and bung a "www." for'ard and a ".com" aft, but both now have very good URL completers (for URLs that have been previously visited). The Fastlinks facility for both is good, with Voyager possibly taking the edge since you can take the fastlinks section right out of Voyager's main window, allowing

iBrowse allows you to view multiple sites inside one browser window, and doesn't slow down at all doing it (if you have the memory).

# Hypercom Zorro

Simon Goodwin checks out the 3+ and 4+ revisions of Hypercom

**H**ypercom interfaces have won a good reputation for augmenting the performance of the stock A1200 serial and parallel ports. Now Zorro expert Jens Schönfeld has joined forces with VMC to produce versions for big-box Amigas.

Like his latest CatWeasel and Buddha cards, the new Hypercoms are small black boards, just long enough to accommodate the Zorro connector. The card is only supported by the 100-way Zorro slot, so if your socket is badly worn it might not be tight enough. Flying leads carry serial and parallel

controlled by one ST16552 chip, as found in faster PCs, IOBlix and GVP's full length IOExtender. Zorro interfacing is handled by a small socketed MACH210 gate array supported by half a dozen standard chips, soldered down, including a 7.3728 MHz crystal oscillator.

The Hypercom 4+ uses extra buffers and two 16552 interface chips, for twice as many ports: two parallel and four serial, on four brackets. If that's still not enough you can fit up to five cards, for 20 serial and 10

The Hypercom ports work with camd.library and Amiga MIDI adapters. This is an advantage over bsc's Multiface, which lacks MIDI and Hypercom's top rates, but sadly old Amiga MIDI software only works with the motherboard port.

### LIMITS

Two-way 16 byte buffers boost transfer efficiency. Over-runs are minimised, but still possible if naughty software turns off interrupts for longer than Commodore recommend, as the PC interfaces lack the hardware handshaking of the

Hypercom 3+: A quote from HG Wells on the PCB reveals Jens Schönfeld's influence

The Hypercom 4+ is identical except that it has twice as many interface ports

signals to back-panel brackets, where full-size cards would end.

You need one bracket for each parallel socket, a standard 25 way female D type matching the back of the Amiga. Two serial connectors fit on a single bracket as one uses the 25 way male D type, conforming to Amiga and RS-232C standards, while the other has a cut-down PC-AT type nine pin D, familiar to Amiga users as a joystick or mouse socket. You can connect PC serial mice here, but not Amiga-specific controllers; despite the mechanical correspondence, this is a serial rather than controller port.

### VERSIONS

The Zorro Hypercom 3+ has one parallel port and two serial ones,

parallel ports, though these would require a custom panel for 20 brackets and saturate Zorro 2 at top speed.

Serial rates range from teletype 50 baud to 460,800, about 58 Kilobytes per second, through all integer sub-divisors of 460,800. This rule gives a slight error on the MIDI rate, but it's close enough.

otherwise pedestrian Multiface's Motorola chips. Prime offenders are *CyberGraphX* and other bus-hogging Zorro cards. You must avoid performing critical operations with these at the same time as fast serial input; the same clash can affect IOBlix, GVP and similar fast I/O cards.

The shell COPY command shovelled 211,602 bytes from IDE to RAM via null modem link from HC3ZSER00 to HC3ZSER01 in 18.6 seconds at 115,200 baud, averaging 11,376 bytes/second. At 230,400 baud Hypercom managed 22,463 bytes per second, both ways, without obviously slowing the CPU. But at the top rate of 460,400 baud, the interrupt overhead clobbered multi-tasking – mouse pointer movement was jerky, and the system clock missed several seconds during a large COPY,

although the transfer rate exceeded 41K per real second.

The serial ports work as advertised, but the rest of the A4000 struggles to keep up with the top speed. Many people happily use Hypercoms with fast modems and ISDN

“Hypercom interfaces have won a good reputation for augmenting the performance of stock A1200 ports.”

The table lists typical rates, and some oddities. The parallel ports claim transfer rates up to 800 K per second, ample for any current application or peripheral.

## ALTERNATIVES

RIVAL REVIEWS - ZORRO MULTI-I/O INTERFACES				
RBM	IOBlix	AF121	82%	£ 89.95
GVP	IO Extender	AF93	76%	£ 69.95
bsc	Multiface 3	AF93	71%	£ 79.95
Zeus	Spider	AF96	65%	£299.95

The installer supports a bewildering variety of Hypercom variants

connections, so you'll only feel these limits if using several cards, or running all the ports flat out. I got similar results on Mark 1 and Mark 2 Cyberstorm 68060s, both suffering as total transfers approached a million bits per second. Output seems to be the bottleneck, rather than reception, and VMC are investigating further improvements.

**GOODIES**

There's no shortage of extras from Aminet, though the installer just shovels the archives to your chosen directory as VMC say they are forbidden from modifying the shareware archives. You get *NComm 3.06*, a terminal emulator with free public keyfile, the *Hydra 1.0r9* bidirectional transfer package, *PortHandler41*, updating Commodore's generic Workbench 3 code, *PrintManager39*, a shareware spooler, and *AuxHandler2* for remote Shell programming.

You might add *SerMouse* or *NewMouse*, to access PC pointing devices, now you have serial ports to spare. VMC do not bundle a mouse driver as they reckon full compatibility would require a rewrite of Commodore's Input device, but the Aminet drivers work as well on Hypercom as they do on rival serial ports.

The obvious omission, as with IOBlix, is the lack of Workbench preferences for the serial and parallel ports. Older boards like GVP and Multifaces, and even Ateos, have windows to set the serial speed and protocol for each port, and configure the parallel interface. Like RBM, VMC expect you to set these with a mountlist, or by tacking parameters onto the device name when you open it.

The necessary files to mount the ports, at a default speed of 11,5200 baud, are included in the 'port handler' archive, but you must extract and copy these manually, editing them as necessary for other speeds or protocols. VMC reckon most people will just configure the device name, unit and speed directly into their communications software.

Device names identify the type and

VMC have commissioned a translation of their current German web pages

number of the board, from "hyperCOM30Z.device" for the first twin-serial card, to "hyperCOM44.device" for the fifth four-porter. There are a dozen drivers supplied, each around 11K long, customised for different hardware addresses. The unit number, 0 to 3, selects between serial connectors on each board.

**PARALLEL**

It's a relief to find a single HyperPAR device for up to ten parallel ports, on any flavour of Hypercom; be they daughterboard, clock port or Zorro, the ports are simply differentiated by unit numbers from 0 to 9. *PrintManager* and *Workbench 3.5* allow parallel port redirection, but parallel sound samplers only work with the motherboard port.

The shareware *PrintManager* handles spooling and print redirection

Term manages Hypercom ZModem transfers marginally faster than IOBlix

The Hypercom parallel port is potentially a lot faster than the Amiga motherboard one. At best, it sent 6.9 MB of PostScript to a laser in 40 seconds, versus 155 seconds for the same data from the A4000T parallel port. Another test delivered 24 pages of HP-PCL5 graphics at 600 DPI to a 128 MB Lexmark laser printer in a minute, rivalling photocopier speeds. You won't notice much advantage unless your printer has a big buffer. With budget printers and scanners that handle a line at a time, the device is the bottleneck, rather than the port.

Hypercom drivers are now available for the Amiga port of NetBSD Unix, and being tested for APUS and Linux68K. The *ScanQuix* author has Hypercom 4+ working nicely with the software originally written for IOBlix. There is no *ProNet* implementation yet for the Hypercom parallel port, but VMC say it could be easily adapted from the GVP version. A parallel ZIP driver with full Amiga support for diskchange and SCSI commands is not yet ready for release.

**DEUTSCH**

An installer script transfers the latest devices, libraries, documentation and 'goodies'. The floppy contained a short English readme file, but the *Install\_HyperIO\_English* script had German 'help', and the English *HyperIO.guide* just referred readers to updates on the German-language VMC bulletin board and web site.

The only printed documentation was a single sheet, also in German, but Active promptly faxed me an English instruction page when I pointed out the deficiency. It's pretty obvious how to fit the board and brackets, with no jumpers to worry about. Pin one is marked, but not the port numbers, which start at zero nearest the Zorro connector.

**UPGRADE**

The latest drivers are on AFCD44, with a helpful 47K English *AmigaGuide*, almost 20 A4 pages when printed, noting terminal, *Genesis* and *Miami* optimisations. The updates offer provisional fixes for Mac emulation, *Miami* and some 68040 boards. It also supports the original Hypercom and daughterboard expansion ports.

Active contend that the vast majority of UK Amigans mainly need a faster serial port and have 68030s and line-at-a-time printers which show little benefit from quicker interfacing. They acknowledge that English is VMC's weak area, which is why they produced their own page of instructions. VMC's A1200 products already have printed documentation in English.

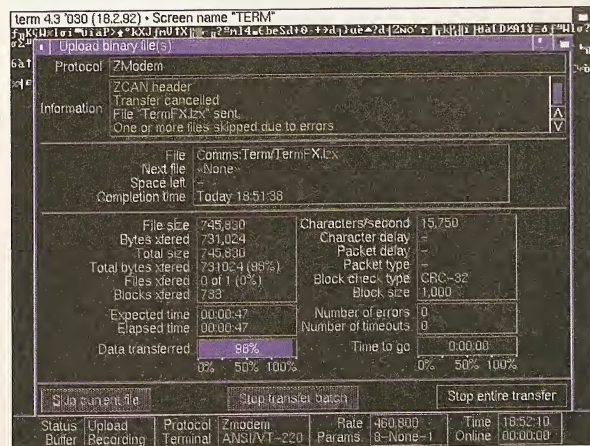

The Hypercom 3+ delivers the features of GVP's classic IOExtender, bar *ProNet* and the GUI front end, at a much lower price, while the 4+ is a bargain compared with IOBlix. Hypercoms work well, cost £20 less than rivals, and seem sure of further development and support

# Extreme 1.50

Richard Drummond dons his shades before looking at **Darkage Software's** video effects generator.

At this year's World of Amiga show I was accosted by an enthusiastic Italian bearing a copy of *Amiga Format* which he opened up to the PD Select pages. Oh no, thought I, he's going to complain about one of my reviews. But he didn't. He thanked me for my review of *Extreme* and asked me if I would like to review the full version.

on two floppies in a neat plastic wallet. No printed instructions are provided, but the guide file is fairly complete. Most of *Extreme's* features are fairly obvious, anyway, and on-line help is provided within the program. A set of extra bitmaps form

part of the package. More are available from the Aminet (and this issue's coverdisc).

The final sub-window is an about window which gives some information about Darkage software.

## CONCLUSION

The effects that *Extreme* produces are potentially excellent. Achieving good effects is rather hit-and-miss affair, though. You have to select the bitmap, configure the options and then launch the effect. If it looks terrible you have to cancel it and go back to tweak the settings some more. It would be so much more quick and easy if it were possible to modify an effect's parameters whilst it was running. A preview option to view the selected bitmap would be handy, too.

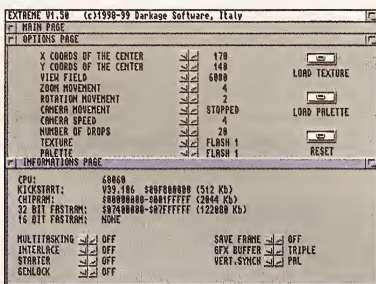

Having said that, *Extreme* is a unique piece of software and straightforward to use. It can produce some jaw-dropping visual effects, especially with good bitmaps. Unfortunately, I doubt that many will find a practical use for it.

**66** *Extreme is a real time effects generator – it creates those swirly plasma effects that are so common in demos.*

**99**

Extreme is let down by its restrictive interface.

## GETTING IT TO WORK

When *Extreme* is started it pops up a requester asking you to select a screenmode for the interface to open in but it limits you to selecting only those modes which are 640 pixels wide. And no matter which mode you choose the resulting screen is 256 pixels high. Also, all the windows that the program opens are non-sizable. This combination is frustrating since it does not allow you to make full use of screen size even if you force the screenmode with a promotion tool.

*Extreme's* main window consists of a colourful logo and some buttons which pop up any of the four sub-windows. The first of these selects and launches the desired effect. This will continue running until you click the mouse again.

The options window allows you to tweak the select effect by changing such attributes as 'Camera speed' and 'Rotation movement'. This window also allows you to select the bitmap and the palette – either a built-in pair or by loading them in. Usable bitmaps must be stored in a raw chunky format and the palette stored separately. It would be more flexible if the program could use any old bitmap file format and process it internally. Also, it is awkward to have to select the bitmap and palette separately.

The third window, called Info, supplies some information about your system and provides more options. Here you may turn-off multitasking during effects generation (useful if you are short on CPU power) and select whether the effects are generated on a PAL or NTSC, interlaced or standard screen. You may also turn on synchronization with a genlock and choose a 'Save Frame' option. This last will save the final frame of an effect to the RAM disk – handy for getting screen grabs when reviewing this product.

Static screenshots do no justice to the splendour of *Extreme's* effects.

**DEVELOPER:** Darkage Software  
**+39 0347 7710333**  
<http://www.idealialia.net/darkage>  
**PRICE:** 10.32 Euros (currently about £7)  
**REQUIRES:** AGA Amiga with 1MB Fast RAM

## WHAT IS IT?

*Extreme* is a touted as a realtime heavy effects generator. What this means to the layman is that it creates those swirly plasma effects that are so common in demos. You supply it a bitmap and a colour palette and it mathematically transforms it in real time on screen in a variety of user-definable ways for your visual pleasure. Does it have a purpose? Well, its intended use is for creating interesting backgrounds for video titling, etc.

*Extreme* is supplied

Believe it or not, this effect started off life as a Boing ball.

## Pros and Cons

- Capable of producing some stunning effects
- Great value for money.
- Online help
- Inflexible GUI

**OVERALL VERDICT:**  
 Loads of fun, but not very practical.

# Power CD-ROM

People still releasing CD-ROM drives? People still not got a CD?

Ben Vost wonders...

Power Computing have offered Amiga users CD-ROM drives for quite some time now (more than six years), and they've been getting ever cheaper, faster and simpler to install. The latest drive from them comes complete with *EIDE99* and one of Power's new four-way IDE splitters (enthusiastically reviewed by Simon Goodwin in *AF124*, page 47, 92%) and is a doddle to fit. By now, most of you will have had some experience of plugging in one of the many IDE adaptors available, but Power's is the neatest yet, fitting nicely under the keyboard. The drive itself is nothing to really shout about, being based, as it is, on a laptop 8x ATAPI CD-ROM drive. The drive doesn't eject all the way, and has to be pulled out by hand, but the it is practically silent in operation, has a very tiny footprint and looks nice in its enamelled case.

The Eyetech drive we were using had a big bonus in the form of audio pass through cables that allowed you to mix your CD audio with your Amiga's in a very easy fashion, but then, that drive is a more expensive than this one, and also comes with a much larger power supply, and without the nifty IDE adaptor.

People will also be saying that an eight speed drive is passé, that they want a 32x, 40x or even 44x speed unit, but at the end of the day I can honestly say that it's no faster – I have a 24x SCSI drive in my Amiga at home and in fact it's actually slower than the 8x IDE drive I have in my A4000 here. Why? Because of the spin-up time of the drive. 8x is about the most a CD-ROM drive can do

Look at all the stuff you get!  
There are even a couple of old CD™ titles thrown in.

without having to endure lengthy spin-up times – times that get worse the faster the drive is. It may be a huge advantage to have a 24x drive if you were copying a single 400MB file

than on my 8x drive here at work which is fully

motorised, although your mileage may vary. The audio passthrough is a shame. Other than that, you've got a really nifty drive, in nice packaging that works really well for your £70 notes. Get it. 

“ Power's new CD-ROM is pretty good. Good value for money, good performance and good looks. ”

## WHY BOTHER WITH A CD?

**Why?!** Actually, you may be right. £70 is a lot of money to spend on something you're not sure you need, so here are a couple of reasons:

■ **The AFCD.** Instead of getting about 2MB of stuff every four weeks with AF, you'd get more than 600. In addition to game and serious demos that we would never be able to fit on floppy, we also have a vibrant reader contribution section that contains games, pictures, animations, tools and WB screenshots.

■ **Everything else.** More and more software is coming on CD these days. The latest games, new commercial software and more. It's just too expensive to put things onto floppy now, and much simpler, for the user and supplier, to just deliver a CD.

■ **Music.** A side effect this, rather than the only reason you'd want a CD-ROM drive, but being able to play music on your CD-ROM drive while you work is quite a nice side effect...

off a CD, but how often does an Amiga owner need to do that? Most Amiga CDs are full of little files where the difference between 24x and 8x is infinitesimal. I wish I hadn't replaced my 4x drive now...

Anyway, the upshot of this review is the fact that Power's new CD-ROM is pretty good. Good value for money, good performance and good looks, let down by only two things. One is the pull-out drawer; the other is the lack of an audio pass-through. The pull-out drawer is the worse of the two problems, although it's no biggie. The way it works is that you press the eject button, the drive pops out a little way and you have to pull it the rest of the way out. This is actually quicker to do

**SUPPLIER:** Power Computing (01234) 851500  
**PRICE:** £69.95  
**REQUIREMENTS:** A1200

## Pros and Cons

- Tiny and good-looking
- Extremely quiet
- Good price
- No audio pass-through

**OVERALL VERDICT:**  
A very nice drive, and great for a beginner

# 85%

# ImageFX 4 W.I.P.

## Codename Adrastea

Kermit Woodall Completes his sneak preview of **ImageFX 4** which creates animation for video, as well as animation for the web.

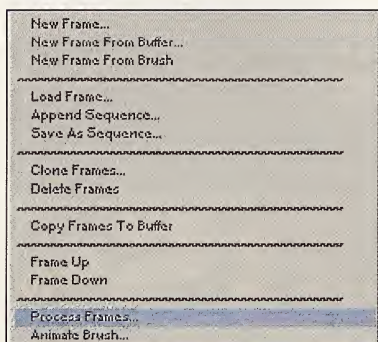

Here we are for the final instalment of my three-part article on our new *ImageFX 4* package. This time around my good friend Ben Vost has properly bought me the promised beefburger and chips. He gave me advance notice, but after all my travel to the World of Amiga show and back, the notice he gave me left me three days to get this together. Fortunately I'm used to working under pressure.

### THE WIDE-WIDE WORLD OF TUTORIALS

This article is going to cover some of the concepts of animating using the new *ImageFX 4*. First off, let's go into the animation system used in *ImageFX*. Rather than imitate some Mac or Windows program we wanted to do animation in a specifically Amigan way. Since *ImageFX* already used *Deluxe Paint* as inspiration for *ImageFX*'s painting tools and key equivalents, we looked to *Dpaint* for animation inspiration as well. As I've detailed in the previous articles we also took inspiration from other sources. The result is an animation system that is rather easy to use, fast, and very much in the style of other Amiga programs.

By now you should have *ImageFX 4*, if not, run out and buy a copy. We'll wait. Got it? Okay, thanks. Let's proceed now.

The first thing to do is load up a sequence of frames as an animation. You could load up an ANIM (animation) file or a GIF animation, or go to the Buffer menu and create a new (blank) buffer and give it a number of frames, but we'll create one here from a sequence of images instead.

Here's *ImageFX* with the **bottomfire** (nothing to do with curries) animation loaded. Note the VCR controls, bottom right

You can use alt-Open or go to the Layers Manager menu and select Load Sequence. The thumbnail file requester will come up (unless you've selected to load using the ASL requester) and you should now select any file from the sequence of images we're going to load. For the purposes of this tutorial we're going to use a sequence from the *ImageFX 4* CD-ROM. Go to the Goodies drawer on the CD-ROM, then into the Pyromania drawer, and finally into the Bottomfire drawer. Click on any of the filenames and then click Okay.

A requester will appear asking for a

**“The first thing to do is to load up a sequence of frames as an animation. You could load up an ANIM or a GIF animation”**

This is the Layers Manager menu whence you can process every frame in an animation

range of frames to load. The number of frames you can load depends entirely on how much RAM you have in your Amiga. If you've got at least 16MB of RAM, enter frames 1-20. Feel free to

load more frames if you have the RAM to hold them. Once you've selected this, the frames will load and you will see the first frame displayed in your buffer window.

You can now try playing around a bit with the VCR controls in the Layer Manager window. If you haven't opened this window yet, click the icon of layers that is just in front of the RGB gadgets on the top of the *ImageFX* menu. The Layers Manager with the VCR-style gadgets will appear. These are fully documented in the manual, but while you're here enjoy playing the animation forwards and backwards. You'll also notice if you zoom in or out (do this when the animation isn't playing) that the size of the displayed image does affect the animation playback speed. The animations themselves are stored with full speed playback values.

If you like to create hand-drawn animations you'll be happy to see *ImageFX 4*'s light-table, or onion-skinning, feature as well. If you've had *ImageFX* prior to version 4 you'll know about the light-table that you could use

between the main and swap buffers. The light-table on offer for animations is even better. The command key is the same, just hit 'L' on the keyboard. When working with frames you'll see three levels of frames making it far easier to reference previous drawings. When working with GIFs, or other colour-mapped (CMAP) animations, you can still see through to the other frames. *ImageFX* can take full advantage of graphic cards to make this even more useful.

### ADDING EFFECTS

Let's add one of *ImageFX's* effects to this animation. One thing to remember before you begin adding anything to an animation is that there is no Undo feature for animations. This is due to two things. First, you often won't have the memory for an Undo in your Amiga and reserving memory for it would cut the available memory in half at least. Second, processing an Undo for every frame of an animation would greatly increase the time it takes for any effect or animation to process. Speed is important to all of us, so we simply recommend that you save your animation before changing it in any way.

Here's where you put all your settings for your flare effect

Oooh! Pretty! A lens flare in its full glory. Well, that is, it would be if it were animated.

“ One thing to remember before you begin adding anything to an animation is that there is no Undo feature ”

Go to the Layers Manager menu and select Process Effect from the menu. You will now see a file requester prompting you to select any one of hundreds of different Arexx scripts to process on your animation. These scripts are the same scripts used by *AutoFX*. You can also use *ImageFX's* macro-recording to store your own scripts here for batch or animation processing. Any script beginning with EOT\_ is for animation. The letters stand for Effect Over Time. Select the EOT\_LensFlare.ifx script.

The menu for this EOT script will come up. By default it should be using the Standard style of Lens Flare. The only things you want to change are the starting and ending coordinates. Start at 0,0 and end at 376,240 – this will animate the Lens Flare moving from the upper left corner to the bottom right corner. Click Okay and watch it

The Animate Brush menu where you input settings for... actually, no, I'll let you guess

process. Depending on the speed of your machine and the number of frames this will take anywhere from a minute to many many minutes.

Once the processing is complete hit the Play button and see the fire animation with a Lens Flare appearing over it. Wasn't that easy?

Let's try the Animate Brush option. To start this we'll load a brush from the directory of simple brushes provided with *ImageFX*. Go to the Brush menu and select Load Brush. Navigate to the ImageFX4:Brushes directory and select the Baseball.IFF brush.

Now go to the drawing options menu. You can bring this up by double clicking on the freehand dot draw icon on the Toolbox. Change the Draw Style to Maximum so only the bright white portion of the ball will be painted onto the image as we animate it.

Go to the Layers Manager menu and select Animate Brush. You will get the Animate Brush menu which allows you to control where the brush moves,

whether it changes size during the move and if it rotates its angle during the move. The only thing we'll change here is the starting and ending coordinates like we did with the Lens Flare. To make the move more obvious we'll move from 376,0 to 0,240 so the ball will animate from the upper right corner to the lower left corner. Once you've entered these, just click Okay to proceed.

More than likely the brush will be animated on the frames so fast you won't notice it happening at first. Just hit the Play button and you will see that it did, indeed, animate the baseball across the image.

### THAT'S A WRAP!

That's a quick overview of the basics of animating in the new *ImageFX 4*. While it's quite similar to animating in *Deluxe Paint* (and therefore quite familiar to all Amigans) it's also quite a bit more powerful with the addition of *ImageFX's* Arexx scripts and macro-recording.

Animations are enormously fun to play with and easy to do. You'll find that you'll be able to save animations in *ImageFX's* INGF format (*ImageFX* Native Graphics Format) for storage during a work-in-progress, convert them to CMAPs and save them as ANIMs or GIFs as well. GIF animations are stored similarly to Amiga ANIMs, so if you wish to add additional GIF tricks, time delays, or other features to them you'd be advised to load the resulting animation into a GIF editor that supports these features. Your basic GIF animations will work just fine directly from *ImageFX* though.

If you have more questions now that I've completed this series of articles feel free to visit our web site or join our Internet mailing list where you can ask questions to all the *ImageFX* experts! Our web site is at <http://www.novadesign.com> and you will find information on joining the mailing list there.

Funky animated baseball thing

# Head-2-Head

Simon Goodwin compares Amiga versions of the former lingua franca of micros

# Amiga Basics

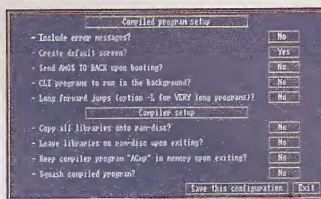

Once one language dominated microcomputer programming: B.A.S.I.C, Beginner's All-purpose Symbolic Instruction Code, invented in 1965 by Kemeny and Kurtz at Dartmouth College. BASIC has come a long way since, but its history explains its strengths and weaknesses. Microsoft BASIC was spawned for the Altair in 1975, ported to CP/M, then built into the vast majority of early home computers, from Commodore, Tandy and Apple. Microsoft BASIC formed the core of MSX, and GW (Gee Whizz) BASIC was automatically translated into the original IBM PC ROMs.

Microsoft's original version of BASIC was a truncated clone of DEC's minicomputer BASIC+, with variable names limited to two characters, ropy arithmetic and few programming structures. Conditions were limited to single lines, leaving a spaghetti tangle of GOTOs to arbitrary line numbers, while GOSUB and one-line functions were the only way to re-use code. Direct memory access with PEEK and POKE was de rigueur.

Variable types owed a lot to Fortran, with single and double precision decimals in four and eight bytes, 16 bit integers, arrays and short strings of up to 255 characters. Structured data types,

## Amos

Francois Lionet's Amos - Amiga Machine Operating System - is derived from STOS, a BASIC interpreter popularly

Amos's simple binary compiler options

used to write simple games on Atari STs, displacing a grim bundled BASIC developed by a placement student at Metacomco in Bristol. STOS played to the strengths of the ST hardware, replacing GEM's feeble desktop with its own front end.

Amos is a world of its own, with friendly buttons but arbitrary limitations like static 'memory banks' which you must juggle to share resources between components. Amos has good manuals, some written by former PiMan Mel Croucher, and its interpretative design yields results promptly. Total sales in the hundreds of thousands prompted the publication of dedicated Amos books. Prolific PD examples include dev/Amos, a whole directory on Aminet.

The 'Easy Amos' version adds accessories and a fine tutorial, but omits the AMAL animation sub-language and cuts the command set in half, from 600 to about 300 keywords. You lose hardware sprites, but retain Blitter Objects. The baroque

The compiler front-end, itself written in Amos

Pro boasts over 800 commands, and a revamped interface with menus as well as buttons. It is more system-friendly, adding error trapping, double-precision maths, ARExx and access to Amiga devices and libraries, but predated AGA systems.

Speed is uninspiring, except by Microsoft standards, even with the optional compiler, making Amos more suited to puzzles than shoot-em-up games, though there are 3D extras, and PD extensions that improve system compatibility. An awful lot of programs have been written with Amos, and alas vice versa.

Amos supports sprites, Amiga screens and samples, but takes over the machine and still has the feel of an old Atari ST program. It crashes fast Amigas, so if you're looking to write programs for others, and for future systems, Amos is bad news. But it's fun if you're fiddling around on a slowish machine and want controlled access to much of the stock Amiga's potential.

## AmigaBASIC

Microsoft's original AmigaBASIC was bundled with Kickstart 1 machines. It can be persuaded to run on a modern Amiga, but it's hardly worth the effort. It needs patches for 68000-specific MOVE SR instructions and is limited to 24 bit addressing, baffled by 32 bit RAM expansion beyond the eight megabyte Zorro 2 limit; on most AGA machines this leaves only slow chip memory for programs.

Microsoft's AmigaBASIC is slowly interpreted and superficial in support for Amiga features. You get windows and screens, but no palette or playfield effects. A graphics editor, written in BASIC, defines three-colour OCS sprites and simple blitter objects, which move under interrupt control with collision detection. Sound commands implement speech and queued samples or beeps for each channel. LIBRARY and BMAP extensions allow unchecked system calls.

The AmigaBASIC manual is dull but not bad, given its age. The only reason to learn AmigaBASIC now is in order to convert old programs from it. Microsoft was justifiably proud of it in 1985, but it does little for a modern Amiga.

AmigaBASIC: Microsoft never really understood multitasking

like Pascal sets and records, C structs or unions, were unknown.

Kemeny and Kurtz were so upset at the Bowdlerisation of their brainchild that they championed an improved version, True BASIC, which was influential but did not stop the rot. True BASIC allowed long names and string slicing - akin to Sinclair BASIC, a rare rival to Microsoft's approach - plus named procedures and functions. It influenced the educational programming language Comal, and BBC Basic for Acorn and Z88 computers, though not enough.

When Microsoft were commissioned to write a new Amiga BASIC for Commodore - who'd recycled the ancient Pet version for the VIC 20 and C64 - they were working on QuickBASIC

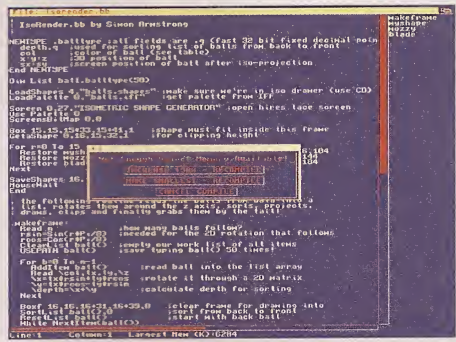

# Blitz BASIC

The selling-point of Blitz BASIC is that it was used to write real commercial games, rather than the half-baked gamelets typical of Amos wannabes. Blitz BASIC 2 brought us *Skidmarks*, *Defender* and even a Spectrum 128 emulator. In each case the built-in assembler took some of the load, but there are some neat demos, like *Zombie Apocalypse* and *Project Buzzbar*, with source in the Public Domain.

Blitz includes an assembler, for plain 68000 rather than 68020 or later code, and a plethora of ready-made routines to perform Amiga-specific tricks. It's full of good ideas, like byte and fixed-point maths, but is incoherent, smacking of an enthusiast's long-term project rather than a commercial product. It was coded by Mark Sibly, but would probably have sunk without trace without support and demos from Simon Armstrong of Acid Software.

Blitz attempts to coexist with Amigas from OCS and Kickstart 1.3 to AGA, and manages fairly well, though the debugger may cause more trouble than it finds, and TED, the integrated editor, is rudimentary. Program source is tokenised, with keywords encoded as binary and displayed in

contrasting colours. TED is modal and takes some getting used to if you're familiar with applications that conform to the Amiga Style Guide. Rather than the conventional copy,

The eccentric Blitz editor in Productivity mode

cut and paste, you mark a block by highlighting it with the mouse and remove it with Amiga K, or copy to the cursor position with Amiga C. You must insert, join and delete lines with menus or Amiga I, J and D, rather than by pressing Enter to split a line, or rubout at the start.

Blitz has copious but chaotic documentation, consisting of two books and megabytes of examples. The A4 reference manual discusses commands and functions by topic, in arbitrary order, with a contents page and four page Command Index.

The first half of the A5 User Guide comprises ten tutorial chapters, followed by appendices and reprints from the defunct 'Blitz User Magazine', with brief examples of over 100 late extras, but no index. You're better off looking through the examples, which are plentiful though erratic in quality. You'll need Commodore's include files, and preferably a set of ROM Kernel manuals, to fathom out the interface between Blitz and AmigaOS.

Blitz is more like C than BASIC, so you gain easy access to hardware and system structures, but lose the parameter-checking and hand-holding of a high-level language. For every correct Blitz program there are dozens of superficially similar ones that misbehave or crash.

It's buggy and does not seem to have been tested with memory management, firing Enforcer hits like magic bullets through the Amiga's soft underbelly. You can write fast, reliable code with Blitz, but it takes trial and error.

Blitz compiler options displayed on an old A500

“ Eight versions of BASIC for the Amiga are discussed here & this month's AFCD is stuffed with BASIC goodies. ”

for Macs and PCs. This added long names, multi-line IF clauses and named SUBroutines with parameters, shared and local variables. Structured programming was possible, though structured data took longer to arrive. The Amiga and Mac environment inspired MOUSE, MENU and TIMER extensions.

Eight versions of BASIC for the Amiga are discussed in the following boxes. Most support a common core of MBASIC commands with various Amiga extras, and can be tried for free. Errol's stuffed this month's AFCD with BASIC goodies.

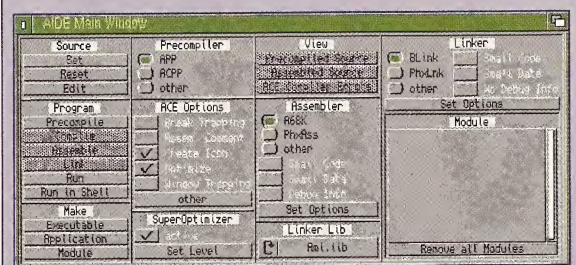

Continued overleaf →

## ACE BASIC

ACE BASIC is freeware. From shaky beginnings David Benn has built a stable compiler that is well-suited for converting programs from older dialects of BASIC, but short of Amiga specifics.

ACE BASIC started out as a command-line compiler for AmigaBASIC programs, later adding support for turtle graphics, system gadgets, structures, pointers and requesters. David and keen users have developed utilities and examples for speech recognition, GUI building, communications and simple graphics.

You use a separate editor, rather than a fully integrated system, to build programs. The package comprises the compiler, documentation and examples, plus your own editor, assembler and linker plucked from the PD, optionally lashed together with GadTools. ACE works, but is more suited to applications and experimentation than games programming.

ACE offers a complicated front end for shell-phobics

## HiSoft BASIC

The strength of HiSoft BASIC, known as Maxon BASIC in Germany, is its conformity to standards. It has a long heritage, derived from HiSoft's ST BASIC, later bundled by Atari, itself adapted from my QL compiler Supercharge. En route it acquired most of the syntax and keywords of AmigaBASIC and Microsoft's PC QuickBASIC 3.

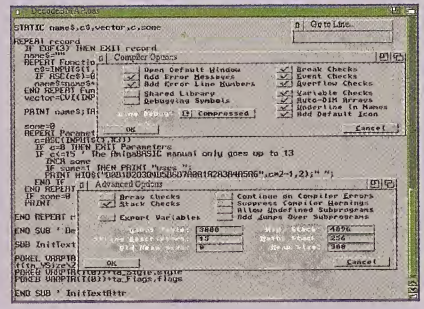

Programs are saved as plain text, so a tokenisation phase is needed to sift out keywords before compilation proper can start. Like Blitz and Amos, HiSoft's editor capitalises keywords on each newly entered line, making simple typos obvious.

AmigaBASIC sprite and sound commands are implemented, but anything more requires the official 'system-friendly' approach. HiSoft has taken pains to convert almost all the examples in the Commodore ROM Kernel Manuals into HiSoft BASIC; much of the support on Aminet consists of third-party include files.

This demonstrates that it's possible to call any system routine from BASIC, but the resultant code may be ugly, full of arcane PEEKs and POKEs, for want of structured data types. HiSoft have chosen to provide stubs to call the system, rather than extend the language with a host of Amos or Blitz-style special commands.

The editor is fast and comprehensive, the manual is great, and the compiler supports big programs and enormous strings. But there's no source level debugger, and misdirected POKEs in system calls can easily cause crashes which the parser is powerless to prevent. HiSoft BASIC limitations stem from the poor correspondence between standard BASIC and the data types used by the AmigaOS, and the chimera of BASIC compatibility.

HiSoft BASIC 2 is professional but looks dull

## OVERVIEW

Contrary to prejudice, BASIC is still usable, although a halfway house, unsuited to large projects. BASIC's strengths are simple syntax, a fast development cycle - especially with interpreters, making it easy to find and fix bugs - and flexible text handling without the perils of unfettered pointers in other languages.

BASIC sits rather uneasily atop AmigaOS, though compiled programs have good compatibility with Kickstart 1. PD extensions fix some of the problems with AMOS and Blitz, and there are plans to rebuild those compilers for modern Amigas; meanwhile they're shaky, with crashes common when we try to run 'reader game' submissions on our expanded Amigas.

*Contrary to prejudice BASIC is still usable, although a halfway house, unsuited to large projects.*

Blitz and Amos are well supported in the PD, and packed with neat extras, but these detract from compatibility. The plethora of dialects makes all but the most vanilla code hard to port, and compiled BASIC is not especially fast or concise. BASIC still has its place, but lags behind ARexx or Perl for quick hacks and communication between applications, Pascal, Modula or Oberon for reliability, and C or assembler for performance.

## The rest

### CURSOR COMPILER

The 20 DM shareware Cursor Compiler is designed to compile and run most AmigaBASIC programs from its Spartan editor. It lacks support for sound, reference parameters and random access files. Cursor is simple but works quite well.

### GFA BASIC

Like Amos, GFA BASIC was ported from the Atari ST. It offers about 300 commands, many of them Amiga-specific. It offered greater speed than Microsoft's offering, boosted further by an optional compiler, but it has poor compatibility with expanded Amigas and was blown away by Amos and later HiSoft BASIC. There's little reason to use it now, but you may find useful GFA programs in the Public Domain.

### PPC BWBASIC

Bywater BASIC dates from 1992 and its ANSI C source was recently ported to PowerUp Amigas. It is a seventies-style interpreter, reminiscent of Microsoft's ancient MBASIC, with fixed-length record filing and no Amiga enhancements. It's free, and runs natively on PPCs, but otherwise primitive.

### EMULATOR BASICS

Classic BASIC interpreters are commonplace in emulators. Code translation slows most down, but gives good compatibility with old sources. Speculator97's BetaBASIC is an eloquent language for quick hacks. Qdos4Amiga runs natively in 68K code, offering Sinclair's powerful, extensible SuperBASIC. But only real Amiga compilers offer efficient graphics and sound.

## Quick comparisons

LANGUAGE	ORIGIN	BEST POINT	WORST POINT
ACE BASIC	Australia	Free	Short of Amiga extras
AmigaBASIC	USA	Once bundled	Hates modern Amigas
Amos BASIC	France	Well-integrated	A world of its own
Blitz BASIC	New Zealand	Good ideas	Flaky implementation
Bywater BASIC	USA	PowerUp native	No Amiga extensions
Cursor compiler	Germany	Editor front-end	AmigaBASIC subset
GFA BASIC	Germany	Not Microsoft	Microsoft-inspired
HiSoft BASIC	United Kingdom	Dependable	Poor data structuring

## PREFERENCES

### COMPATIBILITY

- 1 HiSoft BASIC
- 2 ACE BASIC
- 3 AmigaBASIC
- 4 Blitz BASIC
- 5 Amos

### EXTENSIONS

- 1 Blitz BASIC
- 2 Amos
- 3 HiSoft BASIC
- 4 ACE BASIC
- 5 AmigaBASIC

### PERFORMANCE

- 1 Blitz BASIC
- 2 HiSoft BASIC
- 3 ACE BASIC
- 4 Amos
- 5 AmigaBASIC

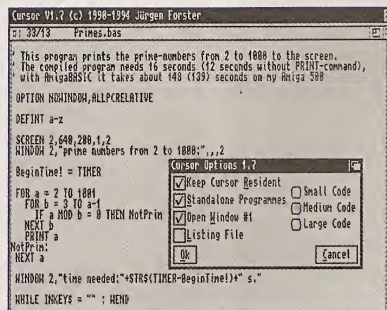

## Prime test results

BASIC	TIME(S)	BYTES
ACE debug	38.9	39376
ACE fast	1.36	33816
Amos 1.35 int	8.5	770
Amos compiler	3.5	57004
Blitz debug	2.85	6712
Blitz fast	0.79	4304
Cursor 1.7	3.3	32788
HiSoft debug	6.5	21736
HiSoft fast	1.07	20732

Our comparison uses a rudimentary program from Aminet to find prime numbers (indivisible integers) up to 3000 on a Cyberstorm Mark 1. Like all benchmarks, it's arbitrary, but this one does something vaguely meaningful, timing the language core when exercising integer loops, tests and the MOD operator. The programs are on AFCD44.

It was not easy to find even a simple program to compile under all five systems. Amos insisted on a GOTO after THEN, Blitz lacks the internal TIMER, and both disdained AmigaBASIC window commands. ACE and Blitz locked up till the jump out of the inner loop was recoded to fiddle with the index instead.

The Amos times compare the interpreter and compiler; ACE, Blitz and HiSoft BASIC 2 results contrast test code against flat-out optimisation, shedding run-time checks and debug data. This makes a big difference to speed.

The Cursor Compiler's conventional interface

# Workbench

Simon Goodwin takes over the role of AF's Agony Uncle. Email: [amformat@futurenet.co.uk](mailto:amformat@futurenet.co.uk), putting Workbench in the subject line, or write to:

**Workbench • Amiga Format • 30 Monmouth Street • Bath • Somerset • BA1 2BW.** **AFCD44: In the Mag/Workbench**

## CABLE MODEMS

I have an un-towered A1200 with an 030/40 processor with 16 meg of fast RAM, a 3.2gig hard drive and a 56k modem amongst other peripherals. I have just read in a net magazine that the cable company NTL are soon to be launching a cable internet service in Northern Ireland. Now this ties in neatly with a message I received from the same company who also do my cable TV and Telephone network. I was told that they would be hopefully starting a new type of internet service in August.

I read in the article though that to connect to this new service I would require a cable modem. Now I believe that to connect this to my Amiga I will need an Ethernet card. Is it possible to connect an Ethernet card to an un-towered Amiga or will I require a tower so I can have Zorro slots at my disposal? I'm hoping that it can be connected to my clock port in some way.

At the same time, I use the excellent Net Connect II and I was wondering how many changes I would need to make to configure this software

## LAYING A CABLE

I write concerning John Kennedy's response to the letter of Thomas Braby in AF 126, who asked about cable modems. As I worked for a company that introduced ADSL in Switzerland and I was the guy technically responsible for it I assume to be able to loose a few words.

First, cable modems and ADSL are two completely different techniques. Cable modems are using the broadband network of Cable Television providers; I think you call this CATV or something similar. The cable modem signal is transported by the same cable infrastructure as the television signals. If you use cable modems somebody will connect the modem to your cable TV connector in your home and then you can connect your computer, normally through Ethernet, to the modem. The cable modem works as a bridge, transforming your Ethernet frames to a frame format suitable to the cable network.

The cable network provider then gives you high speed access (several Mbps) to the Internet. The bandwidth on the cable network is shared between the users, unlike in ADSL.

ADSL has the same goal but here you get a modem that connects to the telephone line in your house. You have a technical maximal bandwidth of 6 Mbps (from the net to your PC) and 600 kbps in the other direction. Of course the real speed depends on what the provider is willing to sell and configure.

You are quite right, the protocol on the telephone line is ADSL. There are special PC cards which directly delivers an ADSL signal and is directly connected to your phone plug. But there are also ADSL modems which connect to your phone plug and offer Ethernet or ATM-25 interfaces to connect your PC (also bridge). These kind of ADSL modems would allow to connect an Amiga through Ethernet.

*Yvan Gutknecht  
Zurich*

*Thanks for that clarification, Yvan. We welcome information from readers who have tried Cable Internet - we're still waiting for BT to offer humble ISDN connections here in Bath!*

to work with the cable network. Keep up the excellent work in your great mag.

*Ewan J Carmichael  
email*

*You can fit an Ethernet card in an un-towered Amiga 1200, via the PCMCIA port. This month's AFCD contains all the software you'll need to use this with NetConnect 2, in the InTheMag/Workbench directory.*

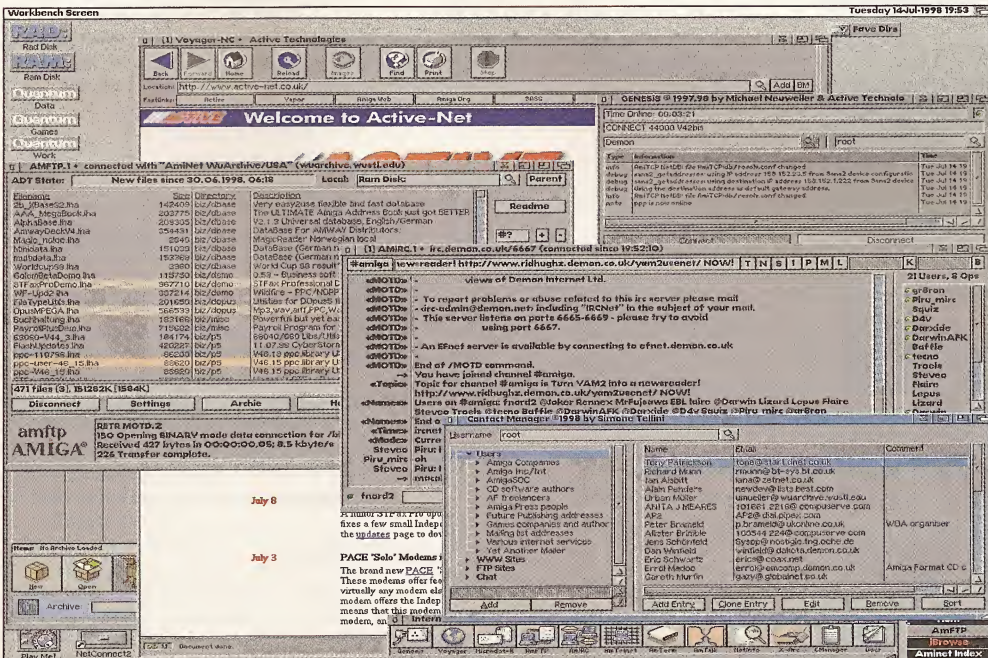

*The only thing to bear in mind is that some PCMCIA adapters do not conform to standards, and require special software. Such a PC or Mac version bundled will not be any use to you, so check the list of compatible cards on the CD before you splash out.*

*Cable Internet connections are a new thing, so read on for advice from another reader who's had first hand experience of their requirements. Bear in mind that your cable company could be doing something weird, but as long as they expect a standard Ethernet connection, the Amiga can provide that just as capably as any PC, Mac or Unix box*

## AUDIO MIXUP

About Simon's article on Amiga audio (Amiga Format 126). His article is very complex and, to be honest there is an easier way of mixing both CD and Amiga sound outputs. I've got the sound of both the CD ROM and the Amiga linked to an external PC speaker system which just has an on/off switch and volume control, this also linked to

**Continued overleaf →**

Whether to connect to the Internet using cable, ISDN or standard phone lines is a choice that more and more people are being given.

← the 486 soundcard which is linked to the Amiga through ami-pc. There are no little solder boards or amplifiers, just a simple switch for Amiga/PC sound, and it works fine. Playing *Quake 1* can listen to a CD using PlayCD from IDEfix.

All you do is buy connectors for each output (Amiga, CD ROM, headphone out) cut the PC speakers wires and you should find 4 wires (usually red, earth, white, earth) and connect them together, i.e. red to red etc. And away you go! In *Quake* you can control background volume (CD) and so mix the two sound outputs together. One problem though... the

**Exercise caution when you jigger around with sound cables. You could end up having to spend money on getting your hardware fixed.**

PC's sound will override the Amiga's even if the switch is set to Amiga.

*David Leacy  
Eire*

*The problem with doing this is that you might damage the output of the CD player or the Amiga. It works for a while, then the reverse voltage from one output to another harms the de-coupling capacitors, which are not designed to be driven the other way round. First the sound is slightly distorted, then it fades out or is reduced to a crackle, and you've got expensive soldering to do in the drive or more likely on the Amiga board to repair matters.*

*This is not just theory - it happens and can be avoided, if you follow the simple instructions in the magazine. The little solder board (or screw connector strip) and associated components protect the Amiga and the CD drive. If you miss them out, you may get away with it for a while, but you should expect problems later*

### PRESSURE

With regard to your article in AF 122 'If it Doesn't Work, Thump It' about Mr O'Brien and his 8x speed external CD-ROM that was making 'strange humming noises', I too had a similar CD-ROM that after a few months' use, started to make the same noises and boot problems that would only stop with a sharp tap to the unit.

The unit in question is an external 8x speed via a Squirrel interface from

Power Computing. After a while I decided to throw caution (and the guarantee) to the wind and open up my CD-ROM. After first unplugging the device from the mains, I removed the outer case and checked the connections and all appeared to be OK.

Then I noticed that the actual drive that is mounted in the case with the power supply was held in place with a large sprung strap across the top of the drive. Deciding that this was putting too much pressure on the drive, I removed it and tried the CD-ROM. It worked, so I took some of the tension from the strap by bending it in the opposite direction slightly and refitted it. It has worked OK ever since. I hope this will help Mr O'Brien and other users with similar problems.

*Mr P Bass  
Grantham*

*You were lucky not to make things worse! I would only try this if the product was out of warranty and I could see no other way of fixing it*

### HARD HEADED

Recently my hard drive died, so I have replaced it with a 6.5 Gb one. At the moment I have only formatted it to 4Gb. Is there a reliable and safe way to use the full 6.5Gb or would I have to buy some extra hardware? I'm using IDE fix, does IDE fix97 offer a patch?

My system is a 40MHz 68040 with 32MB Fast RAM and a x4 CD-ROM, all in a tower. Also, I have 2 pins missing from my Citizen ABC printer. Can I get a new print head, and if so, where from?

*Dave Stone  
Bridgewater*

*There are two simple ways to bypass the 4 Gb limit, if IDE fix won't do the job for you, though Toni at Power reckons the latest version handles big drives OK. The cheapest*

## Feedback

In response to an e-mail in issue 126 from Bridge Deady, subject "*Simon The Sorcerer*". I have the same problem with the CD version, while playing the game, when you click on something it plays all the sounds at once, and often it freezes. I unfortunately don't own an accelerator board, and at first I thought my CD ROM may have been too fast for the game, as I have a 32x Max, but I don't think the speed should matter

*Rebecca Mason  
email*

With regard to the letter titled "Sorcery Problems" in your August Workbench pages, I also had difficulty getting the sound samples in *Simon the Sorcerer* to play correctly on my A1200, which has a 40MHz 68040, an eight-speed IDE CD drive, and uses IDEfix97 and CacheCDF5.

I eventually found that the problem was the caching being done by the CD filesystem. The solution was to create a special DOS driver with no buffers. To run the game I wrote a script which used the KillDev program (part of the IDEFix distribution) to disable the normal CD0: device, mounted the new unbuffered CD0:, then ran the IDEFix CD32 emulator to simulate booting from a twin-speed drive. The game worked perfectly. The IDEFix CD32 emulator doesn't seem to accept any arguments, but it reads its icon tooltypes even when started from the CLI, so I had to make a separate renamed copy, and configure it that way.

I don't know if this information will be of any use to people using SCSI drives and Squirrels, but I hope it helps IDE users.

*Peter Baker  
email*

*Thanks Peter - this just goes to show that fastest is not always best, especially where compatibility is concerned. Back when Simon The Sorcerer was mastered, a double speed drive was state of the art, and the programmers can hardly be blamed for not testing it on eight or 32x speed drives.*

*Simon The Sorcerer seems to be giving many of you problems. Thanks to Peter Baker, there might be a solution here for you.*

## KALEIDOSCOPIC PROBLEMS

I too get the same kaleidoscope of animated lines and dots as Craig Sears (AF126) gets sometimes when I am surfing the web. It only happens on certain web pages that I go to, and then I find it only occurs if I happen to be connected to the IRC or maybe in an email program at the same time. I have to re-boot to get anywhere and I think that I may get knocked offline anyway when the video effects first start to perform.

What I find when I do re-boot and get back online is that I can access the web page that I want to as long as Voyager (the web browser that I use) is the only program that is in use at the time. I hasten to add that this problem has only occurred about 4 times and that the same web page was responsible on 2 of those occasions.

*Ewan J Carmichael  
email*

I've seen similar interactions between YAM and Samplitude Opus. The common factor seems to be running MUI at the same time as other resource-hungry programs, and it does not appear to affect graphics-card screens. Try reading the same pages with AWeb, which does not use MUI - I suspect the problem will disappear.

There is a known problem on AGA systems trying to use maximum brightness white (palette setting 255, 255, 255) which interacts badly with some EMC interference-suppression components added to smooth out the video waveform late in production engineering. This could explain why some web pages trigger breakup of the picture. To test this, back off the brightest colour slightly (254, 254, 254 should be fine) in your palette preferences, and experiment with different browser screen modes.

Power's EIDE99 99 Interface offers a cheap solution to people who have hard drives over 4 Gb. At only £29.95 it comes with all the software you need.

alternative is Power Computing's EIDE99 interface, which includes software to split your drive into three or four 'logical drives' all under 2 Gb in size, which can be formatted and fixed exactly as normal. You pay £29.95, and get Allegro CDFS, control signal buffers and expansion for a couple more drives thrown in.

The software alternative is Workbench 3.5, priced at £34.95, plus the cost of Kickstart 3.1 if you have older ROMs. This includes a new HDToolbox and device code for bigger drives. The snag is that old disk maintenance software like ReOrg, AmiBack and DiskSalv might not recognise the larger partitions until that software is upgraded to Workbench 3.5 standards. Again, you get a lot more than just support for 4 Gb partitions.

If you're determined to avoid extra expense, look at Format64 on Aminet, with scsi.device v43.23 and FastFileSystem 43.12 or later; beta versions were available on <http://www.amiga.de>, along with NSDpatch, which updates older devices to 64 bit addressing, but this is unguaranteed test code and Workbench 3.5 is a simpler and safer bet.

ImageFX is just one of many packages that supports JPEG conversion.

## JPEGS TO DPAIN

Is there any program on the market that will convert JPEG images to the IFF format (and other file formats), so that I can use the images with DPaint V?

I hope I have given you enough information to help me with my problems. Many thanks for an informative magazine, and I hope you never leave us, as I have gleaned loads of information and tips from you. I am now a subscriber and hope to keep my subscription going for many years to come and I really hope other Amiga owners follow my example to keep the mag going.

John Robinson  
Hartlepool

There are dozens of programs to do this. Most professional image manipulation software supports JPEG conversion, including AdPro, ImageFX, Photogenics and PPaint. Aminet has GfxLab24, ImageStudio, ImageEngineer and the SuperView.library which supports dozens of format conversion, including JPEG.

Datatypes allow system-friendly programs like Multiview to decode JPEGs as if they were IFF ILBM files, but currently without support for HAM modes. Sadly DPaint V does not support datatypes without patches, so you're advised to perform the conversion outside DPaint.

Visage and Viewtek appear on AF CDs every month, and can read JPEGs. Once you've got a picture on the screen, you can save it to disk with QuickGrab or SGrab, at the press of a key.

If you know how to type shell commands, Viewtek can do the whole job for you. It's on our CD every month, in the systemtools\graphics\Viewtek drawer. Copy the VT command file to your C: directory, then (for a file called Stan) type:

```
VT STAN.JPEG SAVE STAN.IBLM
```

This reads Stan.JPEG, decodes and displays it, and saves it in Amiga format. You can add command arguments to force a particular screen mode or resolution.

## THERMAL TRIP

I have a problem with my A1200. After using it for about an hour it will start to crash and the only way to reboot it is to switch the computer off for a short time (about 10 minutes) and then it will reboot successfully again.

I am told that the cause may be that the computer is overheating and that turning it off allows it to cool down. If you think this is the cause of the crash, is there any advice you can give me as to how I can overcome the problem? I have removed the cover from the underside of the computer to allow some of the heat to escape.

PF Longley  
Stanmore

That does sound like an overheating problem either in the computer or power supply. If you can borrow another PSU - ideally an A500 one - I'd try that and see if the trouble goes away. Otherwise, power down and unplug everything you can easily remove that takes power - PCMCIA peripherals, trapdoor expansion, external floppies - and try again.

If the computer remains stable, the problem is the excessive load on the PSU. A1200 units vary in capacity; at worst they're barely enough for a 2 Mb machine with internal floppy and no other drives, yet some people get away with an accelerator and internal and external drives before the pips start to squeak.

The power demands of drives and other expansions vary enormously, so it helps if you tell me details of everything you've got plugged in. You might find changing to modern drives, which do not load the A1200's feeble 12 volt line, cures the problem. An A500 supply is far more generous. If the minimal system still fails after an hour or so, you've got a serious problem on your motherboard, and need to send it off for repair or replacement.

The print head for your ABC is available for £39.95 plus VAT from CPC (021772) 654455. The order code is CZBA09701-0. Unless you're really in love with the printer, I suggest saving the money towards a non-impact printer. A Canon or Deskjet will cost under £100 and give far better results, with no pins to break again!

## EAGLE GROUNDED

I have a Eagle Tower with a A4000 motherboard, which I purchased on the 15 August 1996 from Blittersoft. This has served me well but recently I added another SCSI drive requiring removal of a metal cradle which houses the DF0: floppy drive. To remove this cradle the floppy drive has to be unplugged, and I believe I have damaged the small board at the back of the drive which contains one chip and three jumpers. Now I cannot read from DF0:, and info and file requesters hang if I do not remove PC0: from DEVS/DosDrivers. Is a damaged floppy drive likely? If so what can I do to get it working again?

Andy Thomson  
High Wycombe

The most likely explanation is a loose connection at one or other end of the floppy cable. Check that it is fully plugged in at both ends, and check the power supply connection on the back of the drive.

The PC-: DOSdriver problem suggests

that CrossDOS can see the drive, but its a unable to communicate with it. Either the connection or drive are at fault. If your drive has an adapter board, check the connection between this and the mechanism.

The six pins on the back of the floppy drive encode the drive number. For a Commodore DF0:, the last two at the bottom, furthest from the 34 way IDC cable, should be bridged by a jumper. To select DF1, bridge the first two (leftmost and middle pin) in the bottom row of the grid. It's possible that you've lost or moved this jumper. Other makes of drive vary arbitrarily - genuine Commodore drives favour Chinon mechanisms, type FB-354 for 880K formats and FB-357A for dual-speed DD/HD 880/1760K floppies.

If all else fails, you'll have to replace the drive. Options include FDD-ITL1200, a replacement 880K mechanism, £25 from Eyetech, or a combination of Kytvalda boot adapter and a PC drive, which will support standard Amiga floppies at once and HD and higher capacities through CalWeasel. Unfortunately stocks of Commodore drives modified to format 1760K through Paula are exhausted.

## PROTEL POSER

I recently bought a ProTel Teletext Receiver box from First Computers. The package did not come with a Parallel cable as advertised, so I bought one from

Continued overleaf →

← a PC shop. The nearest one I found to the one I needed was a 25-pin male-to-male. I bought a gender-changer to connect the cable to the Teletext unit.

The idea with the system is to plug a video signal into a socket in the Teletext box, run the software and click to start downloading Teletext information plucked from the signal. A green LED is supposed to pop on to signify downloading. When activated, though, the darn thing refuses to do anything, save pop up a 'downloading...' window. I have tried a variety of TV/Video/Aerial setups to provide the signal, with no success. The 50p/min helpline provided with the invoice doesn't cover Amiga problems (so ta very much, then).

Colin Davis  
Swindon

*First Computers got these boxes as a job lot from Gordon Harwood, who notoriously dropped the Amiga, which explains their unhelpful 'helpline'. It's not clear from your letter whether you bought a ProTel without a cable, or paid the extra for one. If the latter, contact First with your order details and they'll make up the deficiency. I spoke to Graham Sharp at First Computers, who was very helpful; in general, the supplier should be your first port of call if you have problems.*

*Otherwise, it's rather unlikely that your 'off the shelf' cable and adapter will fit the bill. It sounds like an RS232 serial cable, which is unlikely to have all 25 pins connected, and may have some wires swapped so each end of a link can talk and listen on distinct lines.*

*You need a lead connecting all 25 pins on the D type plug to the corresponding holes in the socket. A ProGrab cable or fully-wired parallel switch box lead should work fine, which is why First offer a cheaper deal for those who already have something suitable.*

*The green light comes on when the box is receiving a sufficiently strong signal. Check this with a TV - if the aerial does not give a good picture, without ghosting or interference, it's unlikely to be good enough for Teletext, which performs very little error-correction or checking.*

*The other thing you can check is the power supply setting. The red light indicates power; but not necessarily the right voltage. If you've got a meter, check that the supply is delivering ten or more volts, off load.*

## SHARING IP

Having now become fully established Amiga surfers, the only problem my wife and I have is who gets to use the computer. Although we have a 10 meg 030 A1200 running Genesis, we also have a bog standard unexpanded floppy-only A1200, which we use for sequencing. Is it possible to link both our Amigas, so that we can share the same telephone and Internet connection? We only need the unexpanded A1200 to be able to cope with AmIRC, as my wife is a total IRC

## A500 REVIVAL

**I recently caught sight of your magazine in my local newsagent, I picked it up and just had to buy it. This prompted me to pull out my old Amiga 500 out of the loft (its confinement since late 1991). I realised how far behind it is. I therefore have a few questions:**

**Can I upgrade it to something like WB2 or WB3 and does this involve changing any ROM chips? The hard drive it uses is a sort of cartridge which slots in the side. Where can I get one and are there any alternatives? How much will all this set me back?**

**I know I may seem crazy wanting to upgrade my A500, but I don't want a super computer, I just want it to be more useable and not just a games console.**

Glyn Astill  
Nottingham

*Yes, you can upgrade to Workbench 3.1. This involves fitting one 16 bit ROM chip, which will set you back £20. The system disks and four manuals will cost an extra £16, or £20 if bought separately. You might consider upgrading to the latest OS 3.5, which requires the 3.1 ROM, but won't get all the benefit on such an old ECS Amiga.*

*You might also consider getting a ROM*

*switcher for backwards compatibility with some of your old software. This lets you swap back to the old Kickstart when programs demand it, without opening the Amiga case.*

*Commodore, Supra and AlfaData used to make had drive and RAM expansion for the port on the side of the A500, but those ceased production long ago. The only new expansion for 500s is Power Computing's Viper 520, which squeezes a 33MHz 68020 and four IDE ports, including one for an internal 2.5" hard drive, into the A500 case.*

*At £100 with 8Mb RAM, Kickstart 3.0 ROMs and disks it's good value, but that's about as far as you can take an A500, and still weaker than an A1200 with budget acceleration, internal IDE and AGA graphics. In your place, I'd think hard about buying an A1200 with Kickstart 3.1, keeping the A500 power supply and external drive, and putting the basic A500 back in the loft.*

*The sad thing is that the A500 is still a pretty cool computer, though graphically limited by modern standards; you need to find someone who needs a superior 'games console', which is why I opted to palm off my stripped-down 500, with the basic 1200 power supply, to my six year old niece!*

addict. Please help..it could save our marriage!!

Mertle and TinyFlea  
email

*Yes. You need PLIP or MagPLIP, on last month's AFCD, and a suitable cable to link the parallel ports of both machines. Use these to connect the two machines with TCP/IP - Genesis is designed to work this way. Then both computers can be on the net at once. I gave more information about this last month.*

cannot get the text to transfer from the EP22 to the Amiga 1200. What am I doing wrong?

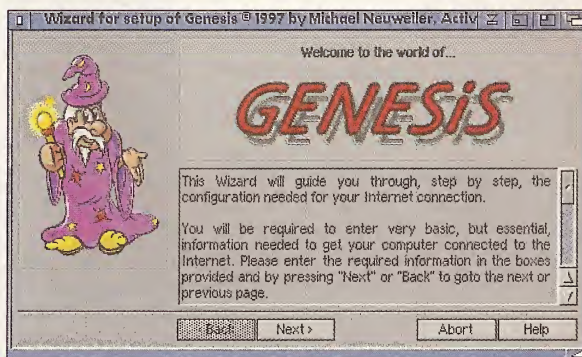

A Sheldon  
Nottingham

*Well, you're not giving me much information, for a start! Serial communications only work if all the options are just right - in particular, the cable and serial port settings have far more 'dud' configurations than working ones. You don't say if you've been able to print to the EP22 with your cable, for example.*

*If the EP22 expects to connect to a printer, rather than a computer, the receive and transmit signals will need to be swapped over, or the Amiga and Brother will both try to talk at once down the same lines, and both listen to other ones, and never hear one another.*

*Check if your Brother is configured as DTE (master) or DCE (slave). Use a straight-through cable if it's wired as DCE (dumb Data Communication Equipment); otherwise swap connections to pins 2 and 3 (Receive and transmit) and 5 and 20 (DTR and CTS, Data Terminal Ready and Clear To Send) so each output is connected to a corresponding input.*

*After that, you need to set the correct data transfer rate. This is a menu option in NCOMM, but probably preset for the EP22 - most likely rates are 1200 or 9600 baud, but your manual should tell you the right value.*

**You want to use Genesis on two computers sharing the same phone line? No problem.**

## OH, BROTHER

I have a Brother EP22 electronic typewriter which has a memory store for ASCII text and a serial 25 pin connector in order to use an external printer. I also have the NComm software but

## IF YOU HAVE A QUERY

**We welcome your queries, but make sure you submit them correctly:**

- Send email to [amformat@futurenet.co.uk](mailto:amformat@futurenet.co.uk) with the subject "Workbench".
- Send letters to the usual AF address (it's on page 94 if you need it), and make sure you put

**"Workbench" on the envelope.**

- Include details about your machine, such as what processor and how much RAM it has.
- Do your best to describe your problem succinctly.
- Make sure it wouldn't be easier to contact the dealer you bought the item from and ask them.
- Be concise!

# Creative

The indispensable guide to getting the most out of your Amiga

## SEND IT IN!

### WE NEED YOUR INPUT

Is there something you would like to be able to do with your Amiga but you don't know how? Perhaps you have an idea for a tutorial on a subject that you haven't seen *Amiga Format* cover before. If you can answer yes to either of these questions, why not write in and tell us?

### PROGRAMMING

Loads of Amiga users like to create their own software. Do you need some help in this area? Perhaps there's a language that's giving you grief or maybe you want to know how to exploit some feature of the Amiga's Operating System. Let us know.

### GRAPHICS

We all know the Amiga is a great tool for creating graphics, but how do you go about it? Is there a particular package you'd like some tips on? Get in touch at the following address:

AF Creative • 30 Monmouth Street • Bath • Somerset • BA1 2BW.  
Email: [richard.drummond@futurenet.co.uk](mailto:richard.drummond@futurenet.co.uk)  
Remember to put "Creative" in the subject line.

It's been a busy month. We've suffered all the furore over Amiga's decision to adopt the Linux kernel for the NG operating system and then we've had the fun and the all-night drinking sessions at the World of Amiga show. And yet, somehow, we've managed to find the time to create the space for four new tutorial pages.

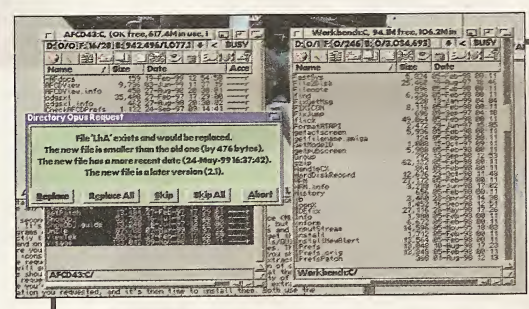

We've decided to put these new pages to good use (not that our other pages are not also put to good use, that is). While our other tutorial series are well-liked by the majority of readers, we felt that we were perhaps not doing enough for the more inexperienced readers of *Amiga Format*. To correct this oversight, we've launched a new series of one-off tutorials, a series of Complete Beginners Guides to... whatever.

Ben starts the ball rolling this issue by telling you everything you need to know to get the most from our cover CDs. Many of you seem to have problems with the CD, so this seemed the ideal place to start.

Remember to send in ideas for any subjects you would like to see get the Complete Beginners Guide treatment.

Richard Drummond

Tony looks at MIDI patch sequencers

Dual playfields: what are they, how are they useful, and how do you go about setting them up?

Find out how to soup up your browser with some plug-ins.

# The complete beginners guide to...

# the AFCD **NEW** Tutorial

Ben Vost introduces the first in an occasional series of complete beginners' tutorials, first up: our CD...

**T**here are quite often topics for which we get asked for tutorials that wouldn't suit our normal six-month, two-page format, so we've decided to do an occasional series of one-off, four-page guides to topics that may not deserve or require further explanation. The first in this series will be the AFCD since some of you have trouble with various facets of it, but please give us ideas for further tutorials of this sort.

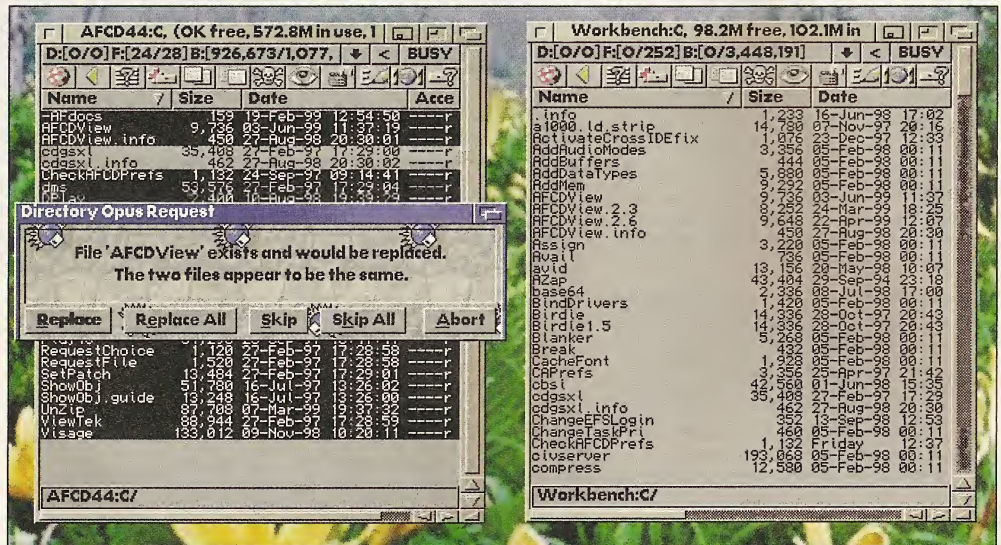

## GET YOUR WORK ON OUR DISC

We still get submissions we can't put on our CD. If yours is one of them - you sent it in ages ago (more than four months) and it still hasn't appeared on the CD - read the submissions advice guide which is part of the HTML in Start\_Here. Did you do all the things it asks you to do? If not, bingo!, that's the reason your work isn't on the CD.

### TOP TIP

To make sure you don't waste time searching CDs you don't have in AFCDFind, set the CD filter to exclude ones you don't have (it's in the menus for AFCDFind) and save your settings.

We like to think our CD is one of the best organised on the planet, but there will always be room for improvement and it does change from issue to issue, so it can sometimes be a little confusing - especially for people new to it, or those that were only used to our old way of doing things. The first thing to bear in mind is the tools and programs you'll probably need to have

Having a file manager makes it easy to see if you already have the latest files on your machine.

*We like to think our CD is one of the best organised on the planet, but there will always be room for improvement*

### TOP TIP

The "Exact matches only" menu item uses AmigaDOS pattern matching. This means that you can narrow your search if you know the exact name of the file you're looking for, or use pattern matching (#?) to replace characters you're unsure of.

The essential tools to make sure your machine is AFCD-ready can be found in this drawer.

on your hard drive before you can even start to get the most out of our disc.

The first and most obvious thing to do would be to actually copy the entire contents of our c drawer into yours. There aren't that many files

### TOP TIP

Don't forget that both AFCDFind and AFCDPrefs have online help. Just put your mouse over the thing you are uncertain about and hit the help key.

Having the same fonts as us ensures your drawers and other icons line up.

**TOP TIP**

The "-s and "+s in the drawer names help make sure that they appear first in a file requester or file manager.

contained within it, and they are all the latest versions, but without having programs like *LhA*, *Installer* and *AFCDView* on your machine, we probably won't get very far. Use a file manager to copy these programs across, or simply open a Shell window and type "copy AFCDXX:c:/#? c:" where AFCDXX should be replaced with the name and number of the CD you are using. Now, we're ready to move onto the next step. Bear in mind that if your hard drive is "mature" you may well already have all these tools in your c: directory, but for those that have just installed Workbench on their machines, this step is essential since you won't have any of the necessary programs yet.

The second thing to do would be to install Magic User Interface (MUI) and ClassAct. It's possible that you won't end

**TOP TIP**

Don't forget that the +System+Tools drawer contains a large number of handy utilities that we've picked to make life easier. They are always kept up-to-date.

**TOP TIP**

If you don't know what a program you're looking for is called, try using a likely part of the name - if it's an AHL sound package, put "AHI" in the search field, or switch to "Exact matches only" and put "#?ahi#?" in the search field.

up using either of them, but a lot of the programs on the CD use one or other of these interface systems and they don't exactly take up a lot of room on your hard drive. The way to get them off the CD and onto your machine would be to go into the +System+/Tools/GUI drawer where you'll see some cardboard box icons and some readme files. The cardboard box icons are all archives and when you double click on one, you should get a file requester appearing which asks you where you'd like to extract the files - it will suggest your

**TOP TIP**

Pictures sent to the Gallery don't need to have a file extension on them. It would be better for them to have a nice name instead of "Pic0137.iff". If you don't want to do that, at least give them a title in your readme.

AFCDPrefs is very easy to set up.

RAM: disk. If you have a memory expansion of some kind this should be enough, but if not, click the "Volume" button at the bottom of the requester and choose a hard drive partition that has plenty of room on it. Once you've done this, the files for MUI and ClassAct will be extracted to the location you requested, and it's then time to install them. Both use the standard Commodore *Installer* program which we copied to your c: directory in our first step. If you still can't run *Installer*, go back and make sure that *Installer* is actually in your c: directory. Once MUI and ClassAct are installed, they both suggest you reboot your machine and will do it for you, so watch out if you extracted the programs to RAM: since that gets emptied every time you reboot.

Okay, once you've installed MUI and ClassAct you're almost ready to get the most from our CD (I know it seems longwinded but it's quite possible you

## What's it mean?

### PATTERN MATCHING

Pattern matching is a powerful tool to allow you to select more than one file by using characters that get replaced. It's hard to explain in such a small area, and the AmigaDOS manual you should have received with your machine actually does contain a pretty decent explanation of it.

### FAQS

FAQs are internet documents that have entered common usage. The acronym FAQ (pronounced "Fack") actually stands for Frequently Asked Questions, and a FAQ is a list of just such, together with their answers.

### MCC FILES

MUI has a system of libraries, much like your Amiga, but kept in the MUI drawer. MCC actually stands for "MUI Custom Class" and .mcc files are often accompanied by .mcp files which are the preference editors for the custom class - the thing that is responsible for a new line of options appearing in your MUI preferences program.

### GUI

An acronym standing for Graphical User Interface (and pronounced "gooey") which is used for Workbench's windows, AFCDFind's controls and pretty much any program's visual front end. MUI and ClassAct both offer alternative GUI's to Workbench's own, with more features and extensibility.

### ARCHIVE

An archive is a single file that is a compressed version of many disparate files. Compressing files this way makes them more transportable (and usually smaller than the separate files would be). Common archive names are LhA, LZx, ZIP, TGZ and DMS.

### FILE MANAGER

A program that gives you a graphical representation of the files on your computer meaning that you only need to use a mouse instead of arcane Shell commands in order to copy, rename, delete or move files. Many file managers can do lots more than this and *Directory Opus Magellan II* is the one we use in the office, but it can be daunting on first exposure to it.

already have these programs installed, so you won't need to worry about the preceding steps). If you want to browse the HTML on our CD, I suggest you copy the whole drawer for the browser you prefer onto your hard drive, and if you choose *iBrowse*, make sure you copy the MCC into your MUI drawer (see the

Continued overleaf →

← *What's it mean?* boxout). This will make browsing the HTML faster, and will also mean that you don't get requesters saying that the CD is write-protected (the reason these requesters appear is that browsers tend to have a cache to make browsing faster, and the cache defaults to being in the browser drawer, which, being on the CD, can't be written to). If you do that, *AFCDPrefs* needs to be told which browser you'd prefer to use, and where it will be, so fire up *AFCDPrefs*, select the HTML entry in the list on the left, then click on the question mark button over on the right-hand side, next to the top text field. This button will bring up a file requester. Go through it to find where you put your browser on your hard drive. Select the program (*iBrowse*'s program is called *iBrowse*, *AWeb*'s is called *AWeb* and *Voyager*'s, just for variety, is called *V*). Save your settings and let's carry on.

The steps you've gone through to this point should ensure that even if you had a bare machine with a freshly installed Workbench you shouldn't get any problems with our CD, but if you don't like the choices of the default file viewers we've made for you, then *AFCDPrefs* is the next place to go. As in the HTML example above, call up *AFCDPrefs*, choose the item from the list on the left that you want to change, and then use the question mark button on the right to set the options the way you want them. This is probably the most powerful aspect of our CDs: the fact that CD-ROM is a read-only medium

## TOP TIP

Using our default programs on the CD as file viewers is never as fast as using ones on your own hard drive.

## -S AND +S

Some people have asked why some of our drawers have "-" or "+" at either end of the name. These won't affect you if you solely use Workbench to move through our CD, but you may be getting irritated with them if you concentrate on using the Shell. The reason for them is to make sure that important directories "float to the top" in file requesters and file manager listers so they don't get lost in a mass of drawer names. It doesn't affect people who use Workbench, it benefits those who use file managers and if you're having problems with it in the Shell, install Kingcon - it's on our CD (in the System/tools/WB drawer). This gives you filename completion, which means that you just need to type the first few characters of a filename, hit tab and KingCon will fill out the rest of the file or drawer name. You don't even have to type any of the name if you don't want to, just hitting tab will be enough for KingCon to bring up a file requester that you can choose the name you want from. If this was KingCon's only ability it would still be worthwhile, but since it also incorporates a proper scrollbar history, drag and drop functionality and the ability to jump between screens it's invaluable.

Switching to exact keyword matching means that you can use AmigaDOS pattern matching to find those files.

but you can choose the settings you want is a great one, and I cringe when I look back at all the old CDs that were hardcoded to use particular file viewers to look at the files on the disc. We had to pick the lowest common denominators so that everyone would be able to use them, but some of the choices were far from perfect for people that had well-specced machines, so this method really is a boon. *AFCDPrefs* also forms a nice complement for users that have installed *Directory Opus*, allowing that program's extensive filetyping support to take care of things. The list of filetypes now included in *AFCDPrefs* is pretty extensive and should cover the vast majority of filetypes you'll come across in everyday Amiga usage, but if you can think of a filetype that we've overlooked, please do tell us!

You are now completely ready to rock and roll, but it would probably be a good idea to know what's on the CD and where things are at. Right now, the CD is divided at its root into six visible drawers and a single icon - the big AF logo with Start\_Here! written under it. Ignoring that for the time being, let's turn our attention to the drawers. I said visible drawers, because, just as with

## TOP TIP

If you get a message saying "cannot create CL\_String" when you start an HTML page and you're using the default HTML viewer iBrowse it just means that you need to copy a needed library file to the correct place. Simply copy the "newstring.mcc" file from the iBrowse drawer on the CD to your MUI:Libs/MUI drawer.

constant in all but two cases. The -ReaderStuff- drawer contains not only all the programs you send in, but also the -Gallery- section of the magazine with your artwork, the -ReaderGames- drawer which will contain the reader games that were reviewed in the issue (by the way, on occasion this drawer is empty. This isn't a mistake, it just means that either there weren't any reader games reviewed that issue, or that they got to the CD too late to go on and would be included on the following AFCD) and lastly the -WB\_Screens- drawer. This contains snapshots of readers' Workbench screens and should always include a list of the tools used

The Serious drawer - like the Screenplay drawer is organised in an easy-to-use fashion since it contains a lot.

Workbench, there are ones that don't have icons, including the c drawer we copied stuff from earlier. However, there aren't many of them, and the main six hold almost everything of interest on the CD (there is a websites drawer which doesn't have an icon, but since you don't need direct access to it it doesn't need one). Each of the six main drawers is further subdivided, with the subdivisions remaining pretty

and an explanation of how the screen looks the way it does.

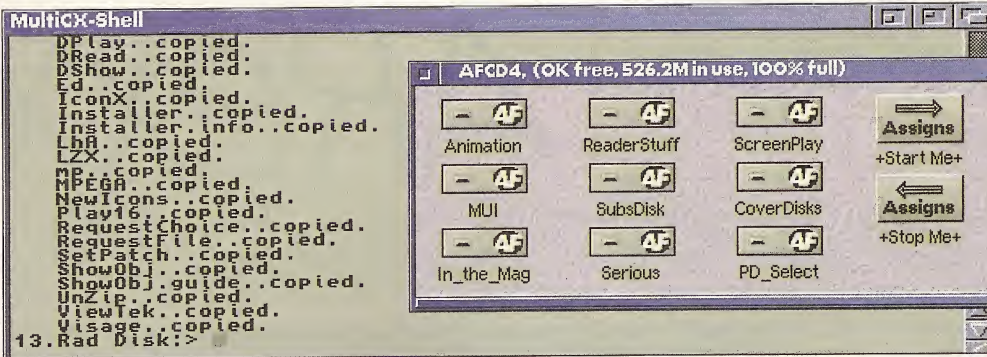

The -Serious- and -ScreenPlay- drawers contain a selection of Aminet downloads sorted into convenient categories, together with items from websites, things that get sent to us by companies for inclusion on the CD (like demos of games or serious products) and more. The -Coverdisks- drawer contains the contents of the

## TOP TIP

If we have PowerPC programs on our CD we try to ensure that the drawer icon has some kind of visual indication on it. Right now, this only works with NewIcons.

## TOP TIP

When you get a new AFCD, run AFCD\_Install in the +System+ drawer. It will make sure that if you are out of date with any of the CD's important files they will be installed on your machine.

A bit of nostalgia as we look back at the hideousness of AFCD4.

floppy disks we covermount, in both extracted and, for your convenience, archived DMS form to allow people who only have access to our CD through a PC the chance to at least copy the DMS files onto floppies which can then be transferred to an Amiga.

The other two drawers – -In\_the\_Mag- and +System+ have contents that do vary from month to month, although they both have regulars. If you've asked for a specific file to be put on one of our CDs, it's a good possibility that it will be found in the ReaderRequests drawer in -In\_the\_Mag-, while *AFCDPrefs* and *AFCDFind* are firmly ensconced in the +System+ drawer.

Last but absolutely, positively, definitely not least is the *AF* icon Start\_Here!. Double clicking on this will fire up the browser of your choosing and bring you to the HTML portion of

If you don't have a file manager, you can always use the Shell.

## TOP TIP

If the icons always need resnapshooting on your machine, it's probably worth your while using the same fonts as we do. FuturaB/12 is for Screen text and XHelvetica/11 is for icons. They can both be found in the CD fonts drawer.

the AFCD. This part of the CD will continue to be an important part of the disc, so ensuring that your browser is working properly is essential to proper enjoyment of our four-weekly disc o' fun. In addition to Rich and I editorialising, all the guidelines for making sure that your work gets on our CD can be found here, along with an expanding series of FAQs about various topics, the transcripts of our mailing list afb, a selection of websites and more.

So you want to try a program from our CD but you find you can't make it work. What next? The best thing you can do is try to find out why exactly this hypothetical program isn't working on your machine. One of the best ways we provide for doing that is to use *SnoopDOS* which you'll find in the +System+/Tools/Expert drawer. Don't

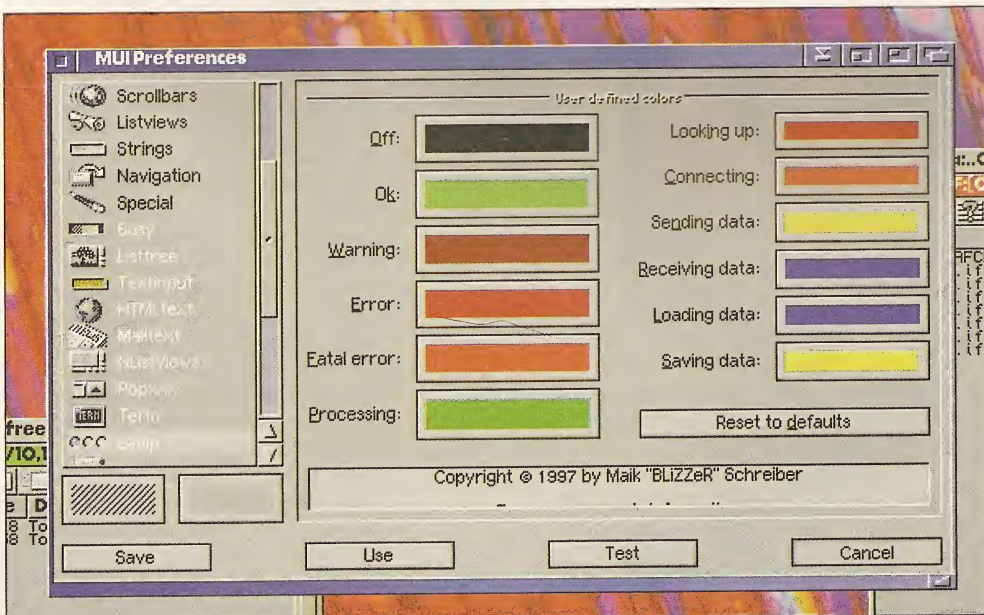

be afraid of it being in that drawer – it's very easy to use. You may get confused by the sheer amount of data it seems to output, wondering how you're ever going to find out what's going wrong, but if you are being overwhelmed, click on the "Functions" button in the main window and click on the first tick box that's labelled "Only show fails". This will dramatically reduce the amount of info you have to wade through and will more than likely show up the cause for the problem. Usually this process will tell you that you're missing a library, font or something similar. If it's a library you're lacking, you can go to the *LibsGuide* program that's also in the +System+/Tools/Expert drawer and run the *AmigaGuide* in there which lists several hundred libraries and where to get them from. If your Workbench has been running for years it may be that you have libraries which never get used these days but you're afraid to chuck them out just in case you've a program that'll want them as soon as you do. *LibsGuide* (and its sister products *DeusGuide* and *DTypeGuide*) has a tool that can examine all the libraries on your machine and tell you what they're used for, whether you're using the latest version and where to get a newer one if you aren't. Well worth a go.

Hopefully this little guide should help you get the most from our CD. Since this is the first tutorial of its kind in *AF*, please give us some feedback on it. Was it too difficult still, or too easy? Was there anything else you think we should have talked about? Did the explanations go into too much detail, or not enough?

## TOP TIP

If you want to be a big help to us when you send stuff in, make sure the default tool for any non-program file you send has "AFCDView" as its default tool.

Magic User Interface (MUI) is an essential part of any modern Amiga – especially one on the net.

## TOP TIP

File managers are incredibly useful things to have, and not just for the experts. A program like *Directory Opus Magellan* is absolutely fantastic, but might be too complex for you if all you wish to do is have a Shell-free and easy way of moving files around on your system. Our CD has DM2, but there are others, and they'll make your life so much easier.

# Useful ARExx

Nick Veitch looks at how easy it is to create functions in ARExx, while pointing out some common pitfalls. Just so you don't fall down any pits.

There is nothing so useful in ARExx as a nice function. Over the last few months we have seen quite a lot of the functions that ARExx has to offer, but now we are going to create some of our own. Creating a function in ARExx is really quite straightforward. It is simply another bit of program code with a label attached to it.

Imagine for a moment, we wanted to work out the percentage of one variable compared to another. It would be pretty simple, I suppose, to write a single line of code to do it. Something like:

```
percent = (x/y)*100
```

And it would probably be easy enough to use that code. It isn't complicated or confusing, or even very long. But supposing instead, you wanted to work out what some flat rate investment would be worth in x years time with compound interest at i%? Hmm, it's going to be a bit tricky to do that in one line isn't it? Well, actually no, and here's the answer:

*We have seen quite a lot of the functions that ARExx has to offer, but now we're going to create some of our own*

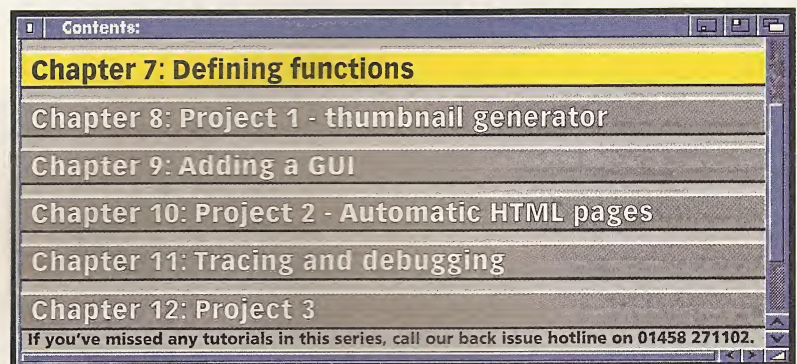

```
networth = compound(capital, x, i)
```

Well, there you go. Simple. Now, since ARExx doesn't actually have a function called 'compound', we'll just have to define it. It would probably look something like this:

```
compound:
DO loop = 1 to y
capital = capital *(1+i/100)
END
RETURN capital
```

And there you are. This still isn't horribly complex, but think how messy your program is going to get if you have to do ten such calculations. And that is what functions are for. They make no difference to the result of the program, they simply make your program neater, easier to understand and easier to write.

For clarity, we've added the `!` sign in the listings to show where you need to enter a RETURN.

## GLOBAL POWER

In the previous example, experienced programmers may have noticed something odd. The function we defined didn't actually read in any values from anywhere, it seemed to already know what the values capital, i and y stood for. And that's indeed what it did, because a standard function in ARExx uses global variables. This can be tricky, as well as useful. Imagine the example function in part of a small program:

```
Arexx compound interest
calculator!
capital = 1000!
i = 7.5!
y = 5!
net = compound(capital)!
say net!
exit!
compound:
DO loop = 1 to y!
capital = capital *(1+i/100)!
END!
RETURN capital!
```

This would work fine, and you would get the correct result for the values given. However, if your program went on and tried to use the capital variable again, you'd find that it no longer had the value 1000 which you gave it, because it has been changed by the function.

The way to get round this is to define the function as a procedure instead:

```
compound: PROCEDURE!
capital = arg(1)!
years = arg(2)!
interest = arg(3)!
DO loop = 1 to years!
capital = capital
```

```
* (1+interest/100)!
END!
RETURN capital!
```

In this case, none of the variables in the main program are altered in any way by what goes on in the loop. That means that the function (or Procedure now) has to get all the values it needs to work when it is called, otherwise it won't be able to calculate anything. It gets these values by using the argument function we have seen before. In the above example, we would call the procedure by saying:

```
net = compound(capital, years,
interest)
```

The three variables, capital, years and interest are passed to the function, which then uses arg(n) to assign these values to its own variables. Note that you don't have to call the variables in the main program anything specific, and you can even pass numbers to this procedure now:

```
net = compound(1000,10,9.8)
```

would still get the correct result placed in the variable net. As the procedure is cut off from the variables in the main program, it now needs to pass a value back. It does this with the RETURN statement. RETURN on its own means that no value is returned – this may not be required if you are using functions to, say, change screen modes, open files, assign colour palettes or whatever. In this case we do want a value returned. Note that it is only one value in this case.

In fact, a procedure can only return a single value, which is a bit of a pain. Say you had a procedure to convert

polar to rectangular co-ordinates (for which, incidentally, you'd first have to write some trigonometry functions for ARExx!), you would want to return a pair of x and y co-ordinates. You could, if you were cunning, return the result as a single string, and then PARSE it into the components you wanted, but it's rather ugly to do this, and procedures are supposed to help you out and make your programs neater. You could always write it as a plain function, and hope that none of the variables are used elsewhere. ARExx has a much better solution though, and it's called EXPOSE:

```
x = 3
y = 4
height = 10
width = 45
call SCALE(6)
SAY `new width` width
SAY `new height` height
SAY `co-ordinates` x y
SCALE: PROCEDURE EXPOSE width
height
x = arg(1)
width = width * x
height = height * x
return
```

In this example, we have a box at 3,4 of dimensions 45x10, and we want to make it six times bigger. When the procedure is called, the EXPOSE statement tells ARExx that the variable names which follow are to be treated as global variables for the purposes of this function. Any other variables we choose to use inside the procedure are still local. In this case, the fact that we have used x inside the procedure doesn't alter its value in the main program at all.

### CROSSED VARIABLES

The trick with exposed variables is not to go mad. If you are writing a long and complex program, it is very easy to forget what you have called all your variables (which is another good reason for assigning them all at the start of the program) and screw everything up. Syntax errors, misspelled filenames or functions are easy errors to weed out of an ARExx script – using the same variable name for two different variables will just screw up anything you wanted to get out of the program, and could take many weeks of painstaking searching before you find the problem. So, only expose the variables you really need to.

Another useful aspect of functions is that they call other functions. Earlier I mentioned a function to convert polar co-ordinates into x and y values. Here is how such a procedure might be written

```
polarstorect: PROCEDURE EXPOSE X
Y
length = arg(1)
angle = arg(2)
```

```
y = length * SINE(angle)
x = length * COSINE (angle)
return
SINE: PROCEDURE
angle = arg(1)
...
return sin
COSINE: PROCEDURE
angle = arg(1)
...
return cos
```

“If you come up with any exciting procedures, please send them to me. I may even give out a prize for the best.”

As you can see, the first procedure calls two other procedures. I haven't detailed the other two procedures, as frankly, they'd be rather long and not particularly interesting. But the principle they demonstrate is useful. You could have created an all in one procedure to do everything for you, and it probably wouldn't have been any bigger than defining all three. But the beauty of splitting them up is that you can use the trig procedures for other things as well now. And it makes it easier to see what everything does.

### RECURSIVE FUNCTIONS

Don't be afraid of calling procedures from within procedures. In fact, here is one last example, whose cunningness relies on it being able to call another procedure – in this case itself!

```
Arexx recursive programming in
action!
Say `Enter a value`
Pull number
result = factorial(number)
```

```
Say number `factorial is:`
result
EXIT
factorial: PROCEDURE
number = arg(1)
result = 1
IF number > 1 THEN DO
result = number*factorial(number-
1)
END
RETURN result
```

It doesn't look very big, but it is clever. This is what's known as a recursive function, because it calls itself, and it is very handy for problems involving self-similarity. What it does is calculate the factorial of a number (very handy for probability problems). The factorial is expressed in mathematics as  $n!$ , and  $n!$  is equal to  $n \cdot n-1 \cdot n-2 \cdot n-3 \dots 1$ . For example  $6! = 6 \cdot 5 \cdot 4 \cdot 3 \cdot 2 \cdot 1 = 720$ , which incidentally is the number of possible results you would get if you recorded a coin being tossed six times.

If you were to calculate it another way, I suppose you could use a loop, but this way is far cleverer, and illustrates how useful ARExx's procedures are.

What happens is that the function is called with a number. If the number is greater than one, it works out that the result of  $n!$  is equal to  $n \cdot (n-1)!$ , so it calls itself for the value of  $(n-1)!$ . This carries on until it gets to 1, because the result of  $1!$  is equal to 1. Only at this point is a value returned, and then it can be passed back through all the iterations until the right answer pops out at the end.

If you come up with any excitingly clever procedures, please send them to me care of *Amiga Format*. I may even give out a prize for the best one.

Be sure to join us next issue when we'll be undertaking our first project – a script that will automatically generate thumbnails of a whole drawer full of pictures.

# Program Perfection

For the perfect program, Richard Drummond says, may the source be with you.

There comes a point in every programming project when you have to stop thinking and get down to writing some code. We haven't quite reached that point yet, but before we do it's a good idea to discuss some issues about source code. Spending some thought on how to perform the style, layout and structuring of your code can make your life so much easier later on.

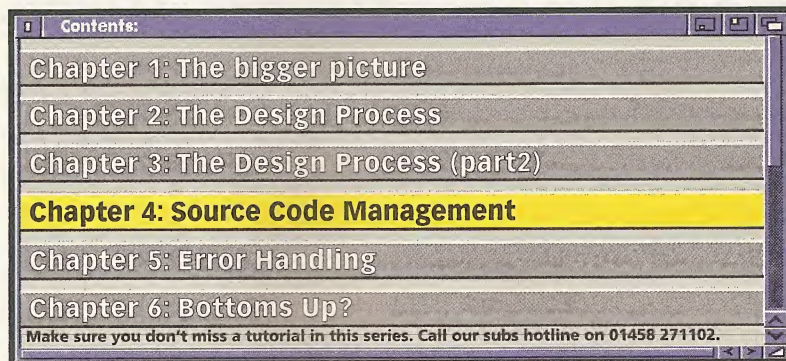

Writing source code in many ways is like writing prose. It is written once and read many times. In both cases, the logic of your arguments should be easily apparent to the reader. While some programmers will delight in trying to bamboozle the reader with the intricacy of their code in an attempt to prove their talent, this is really not helpful to anyone.

## A QUESTION OF STYLE

Most popular programming languages are free format: this means that the amount of whitespace in between the lexical elements of a program is unimportant. You have the freedom to lay out the source code in any way you wish. Don't let this freedom go to your head, though. You can use it to emphasize the logical structure of your program. In block-structured languages such as C, indentation in a powerful tool.

You should develop a style and use it consistently. Programmers always have

For clarity, we've added the `\` sign in the listings to show where you need to enter a Return.

their own personal peculiarities about laying out code and will tell you that their way is right, but as long as there's a reason for whatever style you choose and your system works for you, then

“Writing source code is in many ways like writing prose. It is written once and read many times.”

fine. An editor which performs syntax highlighting and automatic indentation is a particularly useful tool when writing code, particularly if you can adapt it to your own style. Not only will this enforce your style more rigorously, but it is helpful in picking up typing mistakes.

As an example, compare listing one with listing two and decide for yourself which is easier to follow.

## DOCUMENTATION

Amateur programmers tend to have a casual attitude to documenting their code. But documentation is crucial to readability. As an aside, there's a saying which goes: Documentation is like sex. When it's good, it's really good, and when it's bad, it's better than nothing.

There are two types of documentation: commenting and self-documentation. By self-documentation, I mean choosing identifiers for functions names, variables, types, etc. that are themselves informative.

Comments allows us to insert notes into our code which remind us what the purpose of the code is, to point out non-obvious algorithmic steps, or to

explain oddities. We should practice restraint in our commenting, though. There's no point in just echoing the source code itself. For example:

```
i++; /* increment i */\
```

is not very useful.

```
i++; /* increment loop counter */\
```

is much better. In fact, with a more informative choice of variable name, you could do without the comment at all.

Each source file should have a comment at the top which describes the function of that file and lists the author, the creation date and perhaps any revisions made to that file. Each function should be documented stating the purpose of that function and describing all the parameters, any result returned, and any assumptions made by the function. Commenting is also handy for flagging the end of loop. In C the end of a loop body is marked only by the end of statement or program block. Indentation is the only guide to which loop is being closed. Things can be clarified by a comment stating which loop a closing brace belongs to. For example;

```
for( i=0; i < 1000; i++ )\
{\
    /* do something */\
} /* end for */\
```

An intelligent and consistent system for naming identifiers can cut down on the amount of commenting required and

## Listing 1

```
#include <stdio.h>

int square(int x)
{
    return x*x;
}

int main(int argc, char **argv)
{
    int count;

    for(count=0; count<11; count++)
        printf("%d x %d = %d\n", count, count, square(count));
}
```

make programs more readable. One common convention is to use the case of identifier names to reflect the type of an object. For example, local variables and functions should be named entirely in lowercase, global variables and functions should begin with a capital letter, and constants (preprocessor comments or otherwise) written entirely in uppercase.

When a C program is made up from many modules, it is useful to prefix global identifiers with the name of the module where they are declared. This not only makes it obvious where a particular object comes from, but it can help to avoid collisions between identifier names – an especially important point when it comes to re-use.

## MODULARITY

One of our criteria for good software was that it should be modular. But there's no point in designing a modular program if this is not reflected by the structure of the source code. C has rather poor support when it comes to information hiding, so it can require some thought to effectively break up the code into modules.

An obvious tactic is to ensure that each module is implemented in a separate source file. C's equivalent of the module is the compilation unit: one source file and any files that it includes. Breaking up a C program into a series of files can quicken development time, since each file can be compiled separately. Making changes requires that only the source file which is modified need be re-compiled.

So, each module's implementation resides in a separate source file. Also, each module should have a header file specifying that module's interface. This should supply enough, but no more, information for clients that wish to use that module. It is sometimes the practice to lump all these interfaces specifications and other definitions into one large header file which is then included by all the source files. This is not a good idea, because any changes made to that header will require the whole project to be recompiled. It is also a barrier to re-use since the relevant parts from the header will have to be cut

## Listing 2

```

/*
 * program to compute squares
 *
 * RCD 6/8/99
 */

#include <stdio.h>

#define START 1
#define END 10

/*
 * square()
 *
 * PURPOSE: To compute the square of an integer
 * INPUTS: x - the integer to be squared
 * RETURNS: x * x
 */

int
square( int x )
{
    return x * x;
}

/*
 * main()
 */

int
main( int argc,
      char **argv )
{
    int count;

    for( count = START; count < (END + 1); count++ )
    {
        printf( "%d x %d = %d\n", count,
               count,
               square( count ) );
    }
}

```

and pasted into another file to be able to use the corresponding module.

When including headers, you should use precisely only those that are required for that particular compilation unit. This makes it easier to see what services are required by that module and can drastically reduce the amount of time and memory required for compilation. You should also ensure that the same header file is not included more than once. An easy way to achieve this is with the conditional compilation directives of the preprocessor. For example, for a header file called `project.h`

```

#ifndef PROJECT_H
#define PROJECT_H

/* definitions go here... */

#endif /* PROJECT_H */

```

The compilation unit is also the only means in C by which we can achieve private functions, that is, functions only visible within a particular module. In typical, non-helpful C parlance this is the static function.

Once you start working on large projects with many source files, a little outside help is useful to get to grips with the complexity. Commercial compilers like *StormC* or *HiSoft C++* feature an integrated project manager. These will automatically scan your project for dependencies between the separate files and make sure that when changes occur the appropriate files are re-compiled. Alternatively, you can use a make utility. This will achieve similar results but requires the manual creation of a makefile describing the dependencies in your project. While this is a more powerful method, it does involve more work.

# Synth Studies

If you're sick of poking around with the LCD readout on the front of your synth, get a patch editor, says **Tony Horgan**.

**AFCD44: -In the Mag/Synth Studies**

**M**aking a habit of pointing out the numerous ways in which we Amiga users are ignored by the rest of the world would soon get tedious, but when it comes to software support for MIDI devices, it's a familiar story. As with printers, monitors and other peripherals, MIDI gear rarely if ever comes with any Amiga-specific software. However, there's an equally familiar silver lining to this cloud, in the fact that Aminet is loaded with free software to fill the gap.

*A good patch editor will allow you to alter and create new sounds with less bother and access new parameters*

You might be wondering why we need software for our synths and drum machines at all – after all, you can always edit the sounds on the hardware itself, right? Generally that's true, but even then the interfaces on many MIDI devices are far from user-friendly. Most 80s and early 90s MIDI synths use a combination of a few buttons and a tiny, often single line, LCD display, from which all the editing controls are accessed. Also, the space for storing new sounds tends to be limited, usually forcing the user to over-write existing pre-set sounds. Finally, there's the matter of cheap, powerful MIDI modules such as the Yamaha MU10,

Make sure you don't miss a tutorial in this series. Call our subs hotline on 01458 271102.

which have no sound editing controls on the hardware at all (the manufacturers assuming that you'll use the supplied PC or Mac editing software).

So in a nutshell, a good patch editor will allow you to alter and create new sounds with less bother, save as many of these to disk as you like for use in the future, and access parameters that would otherwise be out of reach.

find a different, specifically created editor for each of your devices you want to control in this way. I've had a good snoop around the Net and found software for all the devices listed in the What's Available box. You should find them on this issue's CD.

The exception to this is with General MIDI (GM), XG MIDI and GS MIDI devices. These are standardised in their design, so a GM editor should work with any GM device. XG MIDI is an extension of the GM standard with extra sound banks, and GS is Roland's slight variation of GM (so a GM editor should work fairly well with a GS instrument).

**QS-Edit is one of the elite band of patch editors which was written to take advantage of the extra gadgets available in OS2+.**

## WHY SO MANY?

Because most synths and drum machines have their own specific attributes, abilities and features, it's not possible to have just one generic editor that works with all makes and models of MIDI devices. This means you'll need to

## NATURE OF THE BEAST

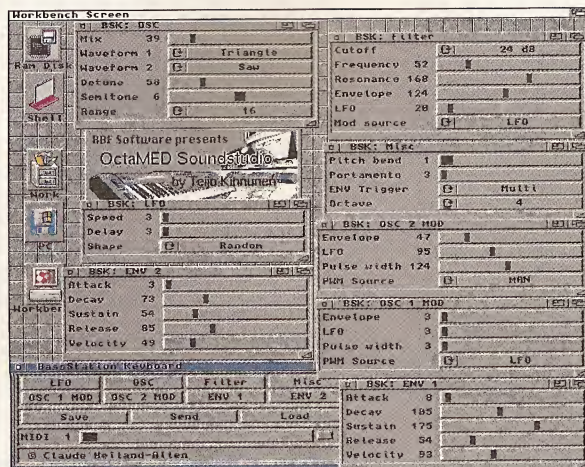

Now a few words of warning. Most of these editors have come into being simply because the authors found themselves in possession of a certain piece of kit with no Amiga software to control it, and in typical Amiga style, decided to write their own. When a programmer writes software for him or herself, the resulting program tends to

be rather more quirky than if it was designed primarily for public consumption. For example, you might find the software will only work in a certain screenmode, which may not be compatible with your monitor, TV or graphics card. It might have been written in such a way as to be incompatible with a whole range of

## WHAT'S AVAILABLE?

Amiga editors are available for the following MIDI instruments. You'll find them on the cover CD (actual archive names are in brackets). Also make sure you check out MIDI System Explorer (MSE) regardless of whether your gear is in this list or not.

- Alesis QS series (qsedit.lha) ■ Casio CZ (CZEd.lha) ■ Kawai K1 (K1\_Editor.lha) ■ Kawai K4 (K4Editor.lha & KawaiEditor.lha) ■ Korg 05R/W (05rw-base.lha) ■ Novation BassStation (Bs.lzx) ■ QuasiMIDI Quasar (QED098.lha)
- Roland D-110 (D110EdDemo.lha) ■ Roland D-20 (VoiceEditor.lha) ■ Roland E-35 (GMPM102.lha) ■ Roland JD-800 (PatchMan.lha) ■ Roland JV-1080 (rolandjv1080.lha)
- Roland JV-80 (rolandjv80.lha) ■ Roland MT32 (io\_mt32.lha)
- Yamaha AN1x (AN1xEd.lha) ■ Yamaha CS1x (CS1xEdit12.lha) ■ Yamaha DX series (DX100.lha & DXEditor093.lha) ■ Yamaha P55-680 (Voice680.lha) ■ Yamaha RY30 (ry30ed.lha) ■ Yamaha SY85 (VEd.lha) ■ Yamaha TG300 (TG300pe14.lha) ■ Yamaha TX81Z & DX 11 (TX81Z.lha)
- Yamaha XG/QS300 (QS300PatchEd.lha) ■ Yamaha XG series (XGed09.lha, XGTool.lha & XG\_Edit.lha)

**A big screen is useful for the BassStation editor, although you don't have to have all the windows open at once.**

## AUDIO TRACK

Each part of this series will be accompanied by an audio track on the CD to give you a better idea of what's being discussed here. This month I've generated six looped sequences using Declan Gorman's fledgling AN1x editor, controlling of course a Yamaha AN1x keyboard. The AN1x can assign sequences to a patch, taking the root note from the note you press on the keyboard. Effects and parameters can be altered for each note, which is how I've got the various filter effects to work. Feel free to sample and use any of them in your own productions without fear of copyright infringements.

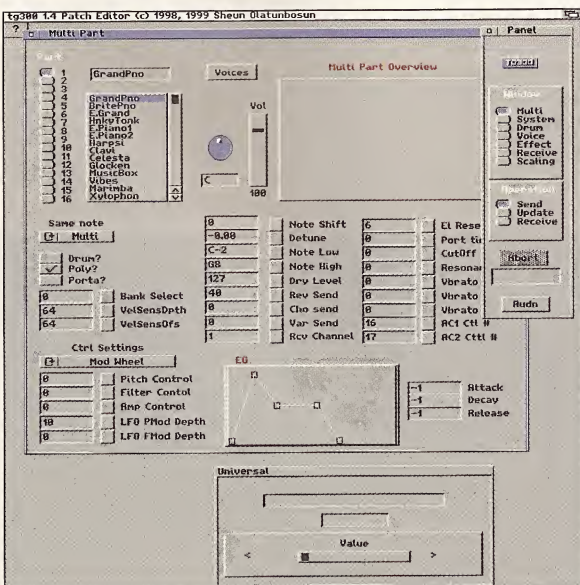

The CS1x editor is one of the best of the bunch, with a logical layout, sliders and even pull-down menus!

peripherals, Workbench hacks or CPUs. So don't be surprised if you find that an editor crashes your system, refuses to quit or sends your display haywire.

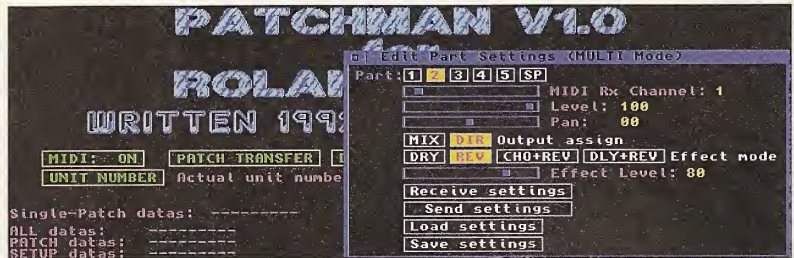

### I CAN DO IT IN THE MIX

One of the best ways to use a patch editor is from within your favourite sequencer. This is not one of OctaMED SoundStudio's strong points, but other sequencers such as Bars and Pipes and Camouflage score highly in this area. When you are using a sequencer alongside a separate patch editor, you'll normally have to keep switching the serial port allocation between each program. Doing it all in one program makes things a lot less fiddly.

Camouflage (the most recent version of which is still awaiting an English language translation) comes with a built-in GM editor. This uses Camouflage's flexible GUI system to give you complete control over a GM

This TG300 editor opens on a 72Hz interlaced Productivity screen by default. If you can't display that, try opening it on another Amiga, changing the settings to a video mode and saving them to disk.

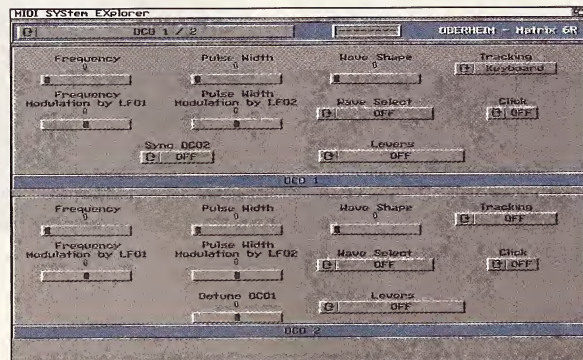

A lot of these editors were written a long time ago, when things like screenmode requesters were rarely seen.

device through a banks of knobs and sliders, and integrates seamlessly with the rest of the program.

Bars and Pipes goes a lot further. Due to its open-ended modular nature, it allows for all kinds of third party plugins to be added. Aminet's mus/midi section is full of this extra tools, and included among these are some patch editors. There's not enough room here to go into them all, so if you're a Bars and Pipes user, the best thing to do is scan that section and pull off the plugins that work with your gear.

### MIDI SYSTEM EXPLORER

The closest thing you'll get to a generic patch editor that actually works is Dthomas Trenn's MIDI System Explorer (MSE). It's also the most well

MIDI System Explorer offers you the chance to write your own modules to suit whatever MIDI devices you want to control.

documented and well behaved of all the editors I've used, with comprehensive AmigaGuide documentation including a walkthrough tutorial. The shareware demo archive comes with support for the following devices: Akai S612; Boss SE50; Oberheim Matrix 6R; Oberheim Matrix 1000; Roland A880; Roland Juno 106; Roland MKS 50; Roland SDX 330. Support in the form of add-on modules is available for various other devices.

MSE uses a kind of programming language to allow anyone to generate a module for a MIDI device. This way, if you've got the time and inclination, you can make modules for all of your equipment.

### TWO NEWCOMERS

My own MIDI set-up includes a Novation BassStation and a Yamaha AN1x. Both have editors available, even though they're both in an unfinished state at the moment. The AN1x software is being developed as a set of standalone

modules, each of which deals with a certain aspect of sound editing. So far there are just two modules, one for the graphic equaliser and another for the built-in sequencer. If you want to try the sequencer part, you'll need to select a screenmode of more than 640 pixels in width.

A BassStation editor has been developed by Claude Heiland-Allen. It comes in two flavours, one each to suit the keyboard and rackmount version of the synth. At the moment it lacks loading and saving features for patches, which makes it a less-appealing option than just tweaking the knobs on the real thing, but development is continuing, so that should change soon.

Now that things actually seem to be happening with the Next Generation Amigas, maybe this kind of sporadic software support will become a thing of the past. I'd like to think so anyway. There's a growing swell of desire for a new kind of computer for artists and musicians, and if Amiga get it right, we should soon see NG Amiga software coming as standard with all electronic musical instruments. For now though, have a shuffy through the stuff on the CD.

## Q&A

**Q** Why are sounds referred to as 'patches'?

**A** It's to do with the way synths used to work, with lots of cables being plugged into various holes, 'patching' the circuits together.

**Q** There's no editor for my synths in that list. What can I do?

**A** It's still possible that there's an editor for your synth out there somewhere. Try searching the Internet and visit the website of your synth's manufacturer. If all else fails, get MSE and with the help of your synth manual, have a go at making your own editor module.

**Q** On the advice of a now defunct magazine, I installed a Yamaha DB50XG soundcard daughterboard to my Amiga. This has no editing controls on it at all and I can't even access the non-General MIDI sounds. Is there something here for me?

**A** Yes. You can use any of the Yamaha XG compatible editors.

# Banging the Metal

Simon Goodwin tickles Amiga bit planes and playfields

AFCD44: In the Mag/Banging The Metal

This issue Amiga screens, bit planes and scrolling playfields drift past our microscope, and I shall explain AGA improvements which let 32 bit Amigas fetch data four times faster than the original models.

Jay Miner's screen architecture still has advantages over other schemes. Even now, rival computers show everything on one screen in a preset mode, laboriously copying display contents as they are moved around. This is inefficient because simple text pages might only use a few colours, yet anything up to 32 bits per pixel might need copying, to preserve the potential for full colour displays elsewhere on a lone general-purpose screen.

The Amiga design allows many screens to be stored in memory at once, flipped between or dragged with the mouse, with no need to copy data. Thus text and file displays can be quickly, concisely rendered in a small number of colours, while applications open other screens in custom modes and sizes for pixel painting, web browsing, games and video.

Last month we saw how the Amiga combines bit values to determine the colour of each pixel. Now we examine the way screens are held in memory, and the way images can be moved around.

**66** The Amiga design allows many screens to be stored in memory at once, switched or dragged by the mouse **99**

## SCREENS

The simplest mono screen uses just one bit per pixel. A default Workbench uses two, giving four colours, MUI expects at least three, for its default eight colour palette, and so on up to six planes for 16 bit Amigas. AGA's allows eight planes, for 256 palette colours or hundreds of thousands in HAM8 mode.

The bits that make up an image are stored in 'planes', each contributing one bit for each pixel. All the planes are the same size, and the total number of planes determines the range of colours. The bits for any one pixel are distributed across all the planes, which is why special 'chunky graphics' tricks have had to be developed for efficient rendering in programs that generate a

If you've missed any tutorials in this series, call our back issue hotline on 01458 271102.

This Amigaified Centipede reserves one playfield for the backdrop, confining game action and collision detection to the other playfield

pixel at a time.

In part 5 we saw the copper setting up pointers to the start of each plane. Each screen is generated by scanning that memory, writing out lines of pixels from top to bottom, then starting again from the top, at the end of the field. Bit planes are allocated from chip memory, where custom chips can read them by Direct Memory Access (DMA).

## AGA BOOST

Original Amiga DMA reads up to 3.6

million 16 bit words every second. AGA doubles and quadruples that rate, allowing any mode in any resolution, by fetching 32 rather than 16 bits, and optionally reading words in pairs.

This enhancement is controlled by two bits in the FMODE register at \$DFF1FC. If the lowest bit is set AGA reads 32 bits instead of 16, but data must be long-word aligned, at an address evenly divisible by 4. Bit 1 asserts 'double CAS' (Column Access Strobe), to read two words in rapid

Arcade sim G-LOC uses one playfield for the cockpit and another for the world outside

Our Blitz BASIC demo swirls two playfields around impressively

succession. Set both for quadruple speed, with bit plane data aligned on 64 bit boundaries.

## WE CONTROL THE VERTICAL

If you allocate memory for extra lines, you can scroll an image up or down by adjusting the address in the copper list which tells the Amiga where to get the first line. Add the value in BPLMOD (the step or 'modulo' between lines) and the plane will move up a line. Normally you do this for all the active planes, or the colours get out of step, but you can shift planes separately for demo images that merge together from top and bottom.

To see this, run CopperFile from a shell then type MORE RAM:CLIST until you see a line like: 1138732 MOVE 63000 to BPL1PTL. Remember both numbers, which will be different on your system, and don't swap screens, or that copper list address will become obsolete. Press Control C to stop MORE, then type something like POKE WORD 1138734 63176.

Here 1138734 is the second word of the MOVE instruction, where the offset 63000 was stored, and the extra 176 is the gap between lines, from BPL0MOD, which varies depending on the mode. You should see a display shift, the effect of fetching bit plane one a line later. POKE the old value back or swap screens to restore normal viewing.

Misdirected POKEing can cause crashes, so save vital data before you try

## Dual Playfield screen scrolling in Blitz BASIC

```
BLITZ ;BASIC 2 demo of dual scrolling playfields
BitMap 0,640,512,3:For i=0 To 149 ;coloured lines
Line Rnd(640),Rnd(512),Rnd(640),Rnd(512),Rnd(7):Next

BitMap 1,640,512,3 :For i=0 To 99 ;coloured balls
Circlef Rnd(640),Rnd(512),Rnd(35)+5,Rnd(6)+1 : Next

Slice 0,44,320,256,$fffa,6,8,16,640,640 : Mouse On

While Joyb(0)=0 : VWait : r+.05 : x1=MouseX
y1=MouseY : x2=160-Sin(r)*160 : y2=128-Cos(r)*128
ShowF 1,x1,y1,x2 : ShowB 0,x2,y2,x1 : Wend : End
```

it. Then try POKEs to alter other BPLPT settings, sliding your screen view through chip memory!

## THE DISPLAY WINDOW

You can have fun with Action Replay on an old Amiga by pressing the magic button then entering 'p' to view the Amiga picture, and using the vertical arrows to move the bit plane pointers. A system-compatible version could combine the above POKEs with PEEKs from the Copper Disassembler.

Each Copper list sets the bounds of the screen in two ways. Display fetch registers tell the custom chips when to start and stop fetching data for each screen line. These are restricted by the amount of data the Amiga must fetch in each gulp of bit plane DMA. We can pan in big steps by adding two or more to each bit plane start address, but only ST users tolerate scrolling on 16 pixel steps, let alone 64.

## WE CONTROL THE HORIZONTAL

The Amiga solution is separate 'display window' registers, which set screen border limits, determining how much video data makes it onto the screen. Shift registers can delay pixel output by up to the time needed to fetch one set of words. Together, these techniques allow smooth horizontal scrolling.

The trick is always to fetch the whole words, setting the display window just after the first word has been fetched. To push the picture to the right, trim the delay so that progressively more pixels of

the first word appear. When the delay is zero, move the bit plane pointers back one word, and start again with maximum delay. The result is pixel-perfect scrolling, with no need to copy any data around.

## DUAL PLAYFIELDS

A scrollable group of bit planes is known by the old Atari term 'playfield'. Amigas can combine two playfields, with one independently scrolling above the other. This arcade trick allows *G-LOC* to render a cockpit in one playfield, with the outside world in a second playfield underneath. *Centipede* similarly overlays dynamic game features over decorative terrain.

Simon Armstrong's *IsoBlaster*, written for AF52, is a fine short BASIC example, with animated characters in one plane moving over a big map, smoothly scrolled underneath. The foreground field is swapped every frame to banish update glitches.

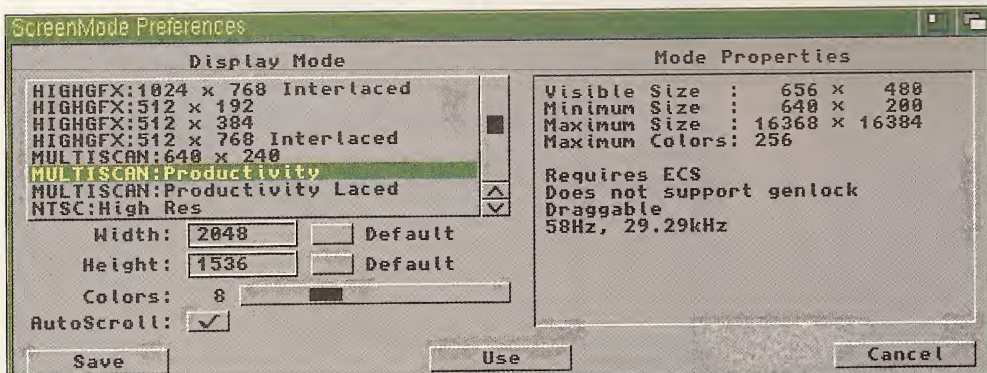

Dual playfields can be different sizes, smooth-scrolling independently, thanks to separate delay and modulo registers for each. This is ideal for parallax scrolling.

This month's Blitz BASIC example consumes hardly any Amiga CPU time, but brings UAE to its knees. Move the blobs over the swirling lines with the mouse, and press the left button to quit when you get dizzy. The arcane SLICE command sets up the custom copper list.

Original Amigas allow up to eight colours per playfield, and extra AGA bit planes permit two 16 colour playfields. The so-called 'AGA' version of the brute-force Amiga emulator doesn't even try to juggle these!

## NEXT ISSUE

Amiga disk handling is another unique feature. The ports are so versatile they've been used for networking and MPEG decoding, as well as floppy drives. Amigas fit more data on any given disk, which is why 'standard' micros are incapable of reading typical Amiga 880K or 1760K formats. No other computer can easily write four disks at once, with negligible overhead! We shall probe the Amiga's floppy secrets next month.

A three megapixel Superbitmap scrolling Magic Workbench leaves chip RAM for Directory Opus and Final Copy at VGA resolution, and five smaller colour screens

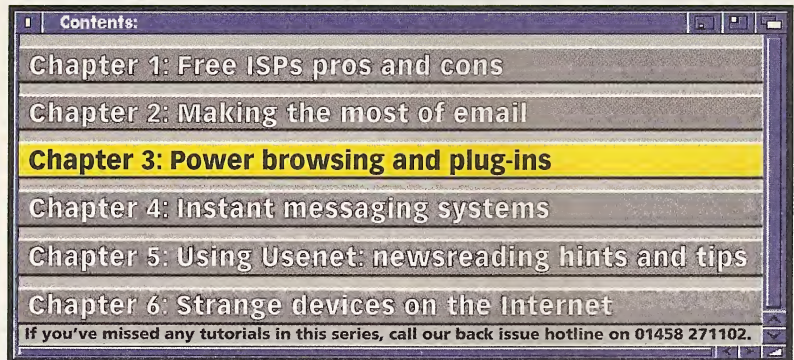

# Amiga.net

Dave Cusick looks at ways of souping up your browser with plug-ins

The Web is constantly evolving, with new multimedia technologies appearing all the time as various companies and developers attempt to enrich the browsing experience for users whilst making themselves a few quid into the bargain. Examples of these technologies are all over the place; a few years ago nobody had thought it would be possible or practical to broadcast audio over the Internet, but

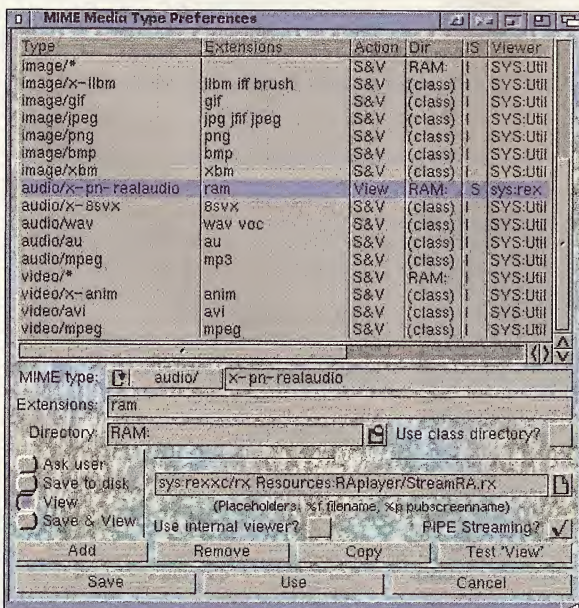

“Plug-ins have become an integral part of the Web browsing experience. Plug-ins expand browser functionality.”

then Real Networks developed RealAudio. Until 18 months ago there was no obvious way of compressing high quality audio into files small enough to be transmitted over the Internet, but then the Mpeg 1 Layer 3 (MP3) format caught on and now, of course, it's so popular that some record companies, unable to resist its momentum, have actually begun to embrace it. Of course it would be unrealistic to expect users to download an updated version of their favourite browser every time a new technology emerged, and just as unrealistic to expect the browser

developers to be able to keep track of all the new technologies and actually implement support for those within their browsers. Even if they could, with so many new technologies out there, browsers would become ridiculously bloated. On the Amiga, where file sizes have always been slim, this would be a major annoyance. Over in PC land, of course, users have to be prepared to launch a 20Mb-plus download every time they want to update Internet Explorer; but contrast that with the latest release of an Amiga browser, which would be well under a tenth of that size. Consequently things called plug-ins have become an integral part of the Web browsing experience. Plug-ins expand the functionality of browsers. Sometimes this can be by doing something as simple as providing

an interface between your browser and your e-mail client so that when you click on an e-mail link on a Web page, your e-mail client is automatically launched, ready to send a new message, with the appropriate e-mail address already entered into the Recipient field. (Of course, some browsers support things like this internally anyway). The most common use of plug-ins though is in enabling browsers to deal with new technologies, therefore enhancing the browsing experience. One of the most popular plug-in dependent technologies on the Internet is RealAudio, a streaming audio format. Effectively it makes it possible to listen to high quality audio over the Internet without having to wait for a large file to be downloaded; heavily compressed audio information is sent in real time.

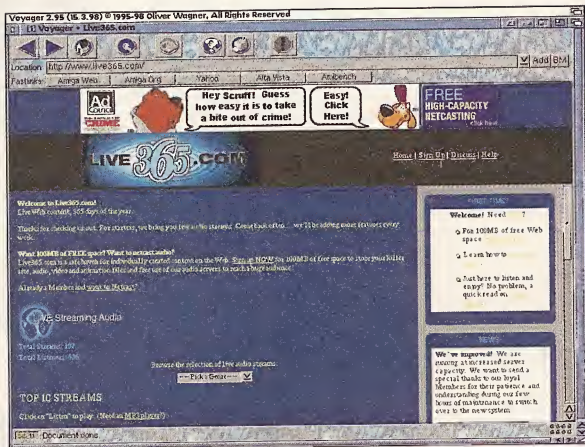

This is how you need to set up Voyager in order to use StreamRA

Don't get your hopes up too high; the sort of files you'll find at cutting edge sites like Broadcast.com won't work

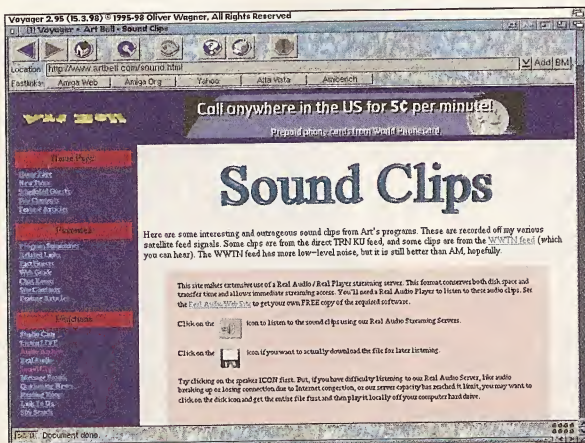

With RealAudio technology, you can listen to live concert Webcasts, tune into Net radio stations, and far more besides. RealAudio has been around in various forms for several years now. Unfortunately its developers, Real Networks, have chosen to ignore a number of platforms completely, and the Amiga has been one of them, so it's only recently that third party ports have opened up the world of RealAudio to Amiga users – albeit in a somewhat limited way. Whilst the PC owning world is using RealMedia G2, (which is version 5 of the software, if my memory serves me correctly) on the Amiga it's only possible to listen to files encoded for use in versions 1 and 2 of RealAudio. If you visit the Amiga RealAudio Support page, in all probability you'll be a little confused as to the best way of setting your Amiga up to use RealAudio – at the time of writing at least, it offers plenty of information but it's scarcely in a very accessible or clear format. But it's really not that difficult getting some basic RealAudio support into your browser. The problem with the approach taken by some of the ports is that because Amiga browsers don't as yet support data streaming, you have to download the entire file before listening to it. To a certain point this defeats the objective of having found a RealAudio file to listen to rather than, for instance, an ordinary MP3 file. Fortunately thanks to the wonders of some nifty programming and some clever little ARexx scripts, it is possible for you to listen to streamed

**Live365 offers plenty of MP3 streams which work well with StreamMP3**

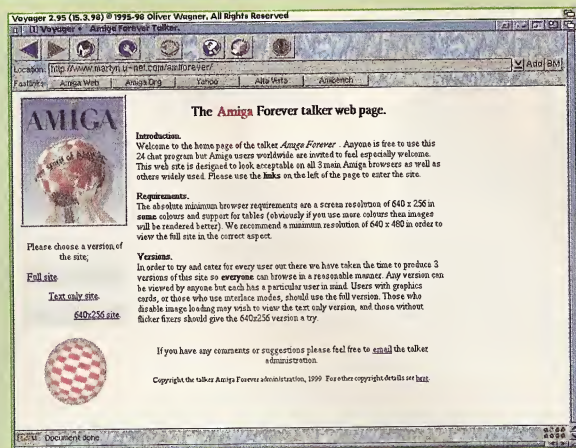

“It's really not that difficult getting some basic RealAudio support into your Amiga's Web browser.”

**Art Bell's page contains a selection of decent RealAudio clips which work well on the Amiga**

## HAPPY TALKING

Fancy the idea of a MUD without the gaming? Well that's how Martyn Bampton describes Amiga Forever, a new talker which he and a few friends have put together. If you don't fancy IRC or ICQ, it's an interesting method of communicating online. Take a peek at the Amiga Forever site, at <http://web.ukonline.co.uk/martyn/amiforever/index.html>, for more about it.

The Amiga Talker Web site

RealAudio files. You won't be able to play them all; most new streamed content uses a different file format which can't yet be decoded on the Amiga. Older files optimised for 14.4k and 28.8k modems will usually work however, and there are still some sites where these can be found. Look for

up, and this is the easiest way of making sure AHI is all up and running. With all this in place, you can follow the instructions in the RALPlayer ReadMe document to configure the MIME preferences in your favourite browser. Take a look at the screenshot to see how Voyager needs to be set up – just create a new MIMEtype and enter everything as it appears here (obviously changing the file path to point to the location of the StreamRA.rx file on your system). To try the system out, visit the Goldtooth page or Art Bell's Page. Unfortunately if you visit one of the cutting edge streaming sites, such as Broadcast.com or even the BBC Online site, you'll find the files on offer won't work. On the subject of streaming technologies, the chap who produced the StreamRA script has also now come up with StreamMP3. This lets you listen to streamed MP3 files. Streamed MP3 files are catching on in a big way because of a system called Shoutcast, which lets users broadcast their own streams from their home computer. There are a number of Web sites through which people can then have their "radio shows" relayed to the world, rather than having to run their own Shoutcast server software (there's a Linux Shoutcast server called Icecast, but as yet no Amiga server.) One such site is Live365. With streaming MP3, unlike with RealAudio on the Amiga, you're right at the cutting edge of development; the technology is only just becoming really popular. What's more, even on a relatively modest modem connection, the audio quality can be pretty good.

 • **Amiga Format** • 30 Monmouth Street • Bath •  
 Somerset • BA1 2BW or email: [amformat@futurenet.co.uk](mailto:amformat@futurenet.co.uk)  
 – putting 'Mailbag' in the subject line.

## SECOND THAT MOTION?

I seem to remember reading in *AF* a few months ago that a 'Prograb Motion' was imminent. Since then I've heard no more about it. Is it still on the cards? Or has it gone the way of other great ideas for the Amiga?

I hope that the position of the Amiga, as the king of computers for the video buff is not going to be lost, and that the makers of hardware/software for the Amiga remember it's up the sleeve!

At this time, with large hard drives, accelerators and memory being easier to buy than ever before, the idea of being able to use non-linear video and sound editing/manipulation/effects, could be just the boost the Amiga needs, especially if it supports cross platform movie, still graphics and sound file formats.

In the August issue mention was made of the fact that the 'Video Toaster' was never made in PAL format. Maybe it would be a good idea for someone to do just that. In the meantime, although I have heard of the Video Toaster, I don't know any details, and would be fascinated to hear a bit more about that particular beast!

FJ Hudson  
Alvaston

*Really? I don't remember putting anything in about a new version of ProGrab recently.*

The Video Toaster – only available for people with a crap TV system.

### ✗ SPARE US

- Long, looong letters with numerous points. Keep it concise!
- Letters addressed to Mailbag that ought to really go elsewhere.
- Questions asking why Amiga aren't advertising on ITV yet
- Technical questions which should be addressed to Workbench

### ✓ SEND US

- More designs for a new Amiga
- What you thought of WoA this year
- Lookielikies for Amiga people
- Comments on the new tutorial format
- Things Amiga need to get right
- General questions you want answered (not technical ones – that's what Workbench is for!)

*Certainly a long time ago, Harwoods promised a more up-to-date version of their video grabber, but I don't think it ever materialised. The nearest that people got to consumer-level non-linear editing (NLE) is MacroSystem's VLab Motion card, but you needed their 16-bit sound card Toccata if you wanted audio with that video. As for the PAL Toaster, it's easy to ask why Newtek never made one, but the Sony chipset they relied on for 90% of the Toaster's abilities was only ever made in NTSC.*

## SINCLAIR NG?

I used to be a Sinclair Computer fanatic way back in the '80s when they sold out to Amstrad on April 7th 1986, before owning C64's and Amigas. One of the terms of Amstrad's buyout was that Sinclair had to submit any further designs for machines to Amstrad, before going ahead. At the time of calling in the receivers it was rumoured that Sinclair's thinktank, Metalabs, were

busy designing the LOKI project, a new powerful computer. Notably, the only offering after the buyout was the Z88 from Cambridge Computers.

Now that Amstrad is dead and buried you would have thought the above mentioned terms are void, and I have read somewhere that around the time that this Amiga NG machine is ready, Sinclair is to unveil a new machine called the Sinclair ZX200, using a revolutionary hardware design. My point to all this: is it a rumour? If not, has there been some recent development in computing that is getting all these companies rising like a phoenix from the ashes again? Competition can only be good news, but Sir Clive Sinclair is and always was an innovator, does he feel the time is ripe in computing for innovation again? Is there a secret development in computing that everyone wants to keep quiet at the moment, what with Amiga

"Recycled narrator humor"

International and its mystery next generation CPU? Or am I just being paranoid, either way this announcement, if true, can only be good news, to the computer industry, computer users and technology overall.

*Mr K.C. Harrison  
Bridlington*

*There are always rumours of new machines popping up all over the place, and I agree, a new machine from sir Clive could only be interesting. However, we'll just have to wait and see - as usual!*

**COLIN GETS A KICKING!**

It's never happened before, BUT, I just had to write and tell you that the person that sets out your magazine needs a good kicking.

In the May 1999 issue the readers' ads and the shopwatch forms were printed back to back. A fact that I had not realised until I had cut out the readers' ads form. Can you please ensure that it does not happen again, because now I can't send in my shopwatch contribution.

Anyway, now that I have had my moan, the magazine is very good, although a little thin. Is there any chance of a tutorial on Imagine 2.0, 3.0, 4.0 or 5.0? I know that you have done one before, but there is a new generation of 3D artists out there now.

In November of 1998, I was watching The Bill on television when they opened a lock-up garage and there inside was a box with 18 inch high letters on saying 'Amiga' (The new logo with the red dot on the 'I'). AND on around the 2nd April 1999 the Amiga got a mention on that week known PC advert, Cybernet.

*Terry Green  
Rotherham*

*Ah well, the perils of not really having enough ads in the magazine, I'm afraid. Still while the following issue probably made your blood boil too, the July ish probably dropped your blood pressure as much as stroking a cat for fourteen hours would have done, no?*

**NEW DESIGN PT. 1**

Hello! My name is Lorianio Pagni and I'm a student of Industrial Design, more specifically Transport Design, at Coventry University. I have been using Commodore computers since 1983: Vic20; C64 - the best 8 bit ever! Sinclair, Atari? Never touched the stuff! And the Amiga... what can I say? Since 1986: A1000; A500; A500+; A1200 expanded - the one that I still own. Superb. I use different computers - Apple and (yuk!) PCs for different reasons but the Amiga is special.

Included you can find a photo of my A1200. This is to show people that if you want to save a bit of money and have fun you can build your own tower from a few bits of wood. In this photo you can see an SVGA monitor connected to the Amiga via a splendid scandoubler/flicker fixer from Eyetech, an A4000 keyboard connected via a Power keyboard interface, the audio goes to the stereo. The tower contains a PC PSU that feeds the motherboard, floppy drive, CD-ROM, hard drive and monitor. The tower also has a transparent plexiglass front cover (not in this photo, so as to avoid reflection).

The other photographs show a concept for a new Amiga case and it's also my entry for the Gallery, so feel free to let me win the prize! The case borrows ideas from the iMac with integrated screen, and the glorious A1000 with the keyboard compartment underneath the case. The case itself is in the shape of an 'A'. It's all made of paper and the new AmigaNG logo is based on a complete new typeface I designed and contains upper and lower case, bold and thin, plus numbers and incidentals. There are side and back views as well. I hope you like it.

PS Sorry about my English, but I'm Italian and I moved to England in '97 to study and then decided to stay. You know, England is cool, apart from the weather and being an Amigan is a bit easier.

PPS Feel free to recommend my design to anyone interested...maybe Amiga Inc?  
PPPS Keep up the good

Here's Lorianio's current setup, with his home-made tower...

work. I have been reading your magazine for more than six years now and I can't wait for the next issue to come out. It's a shame that it only takes me a couple of days to read it all.

*Lorianio Pagni  
Solihull*

*In response to your last point first, there will be extra editorial pages in the next issue, although the issue won't get any thicker. Thanks for your design for the next Amiga - it's great!*

**Continued overleaf →**

...and what he'd like the new Amiga to look like (except presumably not made of cardboard?)

**SICK AS A PARROT**

I bought Championship Manager 2 for £5 (new) a few weeks ago, and for a while I had problems with the game because it crashed fairly often, as it did for Andy Smith (and for other readers if the Mailbag is anything to go by). However, after I removed my external CD-ROM drive interface (a CD1200 plugged into the PCMCIA port), and disabled my hard drive (both partitions) from the early startup menu, the game worked fine. I only have a low-spec Amiga (a 1200 with an external 8 speed CD-ROM drive, 540MB internal hard drive and a 4MB RAM expansion), but this information won't help other readers to run the game. Disabling the hard drive every time you want to play isn't ideal, but at least it works.

By the way, I think Andy was extremely harsh on the game – I find it very good, with some nice touches (such as older players becoming managers – in my saved game, Neville Southall is player-manager of West Ham), and although it is reasonably slow, a lot of people are prepared to wait around for hours, even days, for 3D renders, so a few minutes between matches isn't that much. Just read a magazine or something in the meantime. Still, each to his own, one man's meat and all that...

I only have one more point, and this too is an old chestnut – piracy. You printed a large article in Issue 123 regarding piracy for the Amiga, but then I found, on AFCD 41, in the drawer AFCD41:ScreenPlay/OtherStuff/Itx-stuntcar, the full version of Stunt Car Racer! I don't think you would deliberately put this onto the CD (the readme describes it as a fix, when it is actually the full game), and I suppose it 'slipped through the gate', but I don't think Latex (the group who produced the 'fix') got permission from Geoff Crammond or Microprose, and as far as I know it hasn't been released as freeware. It probably won't affect anyone, but is still the copyright of Geoff Crammond and Microprose, and is therefore copyright theft. Didn't anybody check it before

**TECHNICAL SPEC**

Firstly, I want to say that I am glad Amiga Inc. are almost finished in developing the next generation Amiga technology! The problem is that they still haven't decided the final components in terms of CPU and multimedia chipset. Their shortlist is currently PowerPC, Mips, Alpha, Transmeta, ProjectX and Glaze 3D

Personally, I want the company currently known as Amiga to chose the PPC-64 Altivec to be used as CPU in the AmigaNG, not as the main CPU, but as a CPU to keep 100% compatibility with classic PowerPC games, while AmigaNG specific games will be written for multimedia chips – chips like Transmeta, ProjectX and Glaze 3D (in C++/Java2).

As for multimedia chipset, Amiga should chose Glaze3D as the foundation multimedia chip, on a single multimedia card for the AmigaNG. Since Bitboys OY is currently performance-tuning the architecture of Glaze 3D, it should mean that Glaze 3D should have DVD support, 256-bit local RAMDAC

bus, instead of its 128-bit, HDTV – resolutions up to 2048 X 2048 and perhaps even increase the 400m pixels per second to a maximum of 800m pixels per second. This should make Glaze 3D the fastest, best and the ultimate multimedia chip being programmable for new, added and improved instructions by software, knocking out the new cards like Millennium G400. Maybe the new Glaze 3D should be renamed to something like Millennium Glaze 3D multimedia chipset. All this should make it simpler (and safer) for Amiga to make the right choices. I trust the company Amiga. The future looks bright!

Helge Kralheim  
Norway

Wow! You have some keen ideas for spec for the new machine, but I'm sure Amiga have others. Stay tuned to learn more about the exact contents of the new Amiga in upcoming issues of AF.

the final CD was cut?

Anyway, thanks for your time, and keep up the good work!

Phil Davies  
Caerphilly

*It has to be said that 3D renders are one offs, whereas you'd expect those kind of waits for every match you'd play in CM2, a somewhat different prospect. The fact of the matter is that even if the game had been top-notch, it didn't excuse the developers from not paying attention to the state of the Amigas people are using when they developed the game. I've seen the PC version. They said they had to take lots of stuff out to fit on an Amiga, but they wouldn't have done if they'd actually tried writing for a reasonably modern system.*

*As for the Stunt Car Racer thing, no we weren't aware that it was basically a pirate version, and obviously neither was Urban Müller who runs Aminet (which is where it came from). It only crashes on my machine, so I couldn't check it, besides which we had 23,000 other files to have a look at before we pressed the CD.*

**"And Championship Manager 2 shoots... and skies the ball! The crowd have got to be upset at that, Brian."**

design a mascot competition. If not a mascot, how about a poster design, merchandise, innovative packaging ideas?

Get everyone involved on all platforms, hype it up, and offer a really impressive prize. Few creative types could resist the challenge, and art/design colleges and mags like Computer Arts would surely want to be involved. Think what could be done with all that publicity! Just a thought, anyway. PS Thanks for printing my gallery pictures. I'm not sure what the hand-drawn thing is either...

Nick Rowe  
Halesowen

*The boing ball makes an effective start for a cuddly, chequered PacMan-type of thing. We look forward to seeing all your designs.*

**NEW DESIGN PT. 2**

I know Amiga have their own plans for the logo, but have they considered an Amiga mascot? I ask this because a well designed, recognisable character always has a huge impact on adverts and packaging, as proven by countless games and products. It was Eric Schwartz's characters that made me notice the Amiga – more so than a logo.

So maybe Amiga could start a

See? Col came up with this in five minutes. I'm sure you lot could do better.

## SO IT GOES

So impressed was I when I recently played the demo of Gilbert Goodmate from your coverdisk CD, I just had to write to Alive Mediasoft and ask when it was coming out. Just over three weeks later I received a reply, which in itself would hardly win any prizes for being a letter. This was signed by a Jennie Flowers, telling me they'd dropped it and a company in Herts called Crystal was supposed to be publishing it. So much for that, I thought. But then, maybe Crystal could tell us if and when it's coming out, that is if anyone out there knows their address. With my reply I received a photocopied catalogue offering me the world and informing me they were totally dedicated to the Amiga and, not only that, Number One in England! Great, I thought. Much too good to be true, isn't it? To quote a Steve I finally managed to speak to, 'No one can touch us when it comes to the Amiga, We're the best and for Mail Order we have our finger on the pulse!'. In other words very good at talking but absolutely useless when it comes to any action. Having sent a test order it eventually arrived almost three weeks later, and guess what? Yes the wrong games, well to be fair, two right, one wrong, but no answer to letters requesting them changed. So why then is it I get the impression Alive's run from some schoolboy's bedroom? Could it be because they ignore their mail, don't answer messages left on their so-called Web site or might it be because they send out the wrong orders and do nothing about it? Now, call me old-fashioned if you like, but if you're running a business, isn't it through paying customers you make your money? I'll certainly think twice before ordering anything again. But then, is it just me, or do they treat all your readers the same?

It's all very well for readers like the case of Matthew O'Neil (Issue 125 Mailbag) who tell us 'Everyone who reads AF has read it time and time again, so progress with something else as it's getting boring reading the same old thing'. Well, let me just say there's a great

Poor old Gilbert! Gets his own game, only to be trashed at the last minute. D'oh!

## COMMODORE STOLEN?

Enclosed is something a mate (a PC owner) found while browsing around PC World. I was in shock when I saw it.

I was so shocked to see the Commodore name being used, then even more surprised when there was no sign of what I'd called a Commodore 64. Imagine my horror when I looked on the back only to discover that someone had the nerve to use this wonderful name, but also mention Windows.

From what I can gather it is a PC just for net access, but they must have felt that calling it a PC wouldn't help so they STOLE the Commodore 64 name. At least there isn't an Intel CPU, but AMD is just as bad.

Next year we'll probably be seeing an Atari 800XL version, which was my first home computer.

David Bateman  
York.

*They haven't actually "stolen" the Commodore 64 name. When Commodore went bust Escom bought the Amiga and the Commodore name. However when they closed down, as we know, the Amiga went to Gateway, while the Commodore name languished for a while. Eventually it was bought by Tulip Computers of Holland, and either they've licensed the name to this company, or they've bought the name from Tulip. No-one replied to my emails so I don't know either way. Still seems like a pretty horrible computer to use - Windows 3.1? Ughh.*

Looks nice, but  
crap specification  
- almost the  
opposite of the  
original  
machine.

many of us out here who would very much like to know the basics. I, like countless other Amiga users, was slow off the block and have a lot of catching up to do before I can call myself a gifted immature, let alone someone who knows it all. The Amiga is without doubt a fantastic little machine, but when it comes to the technical side, I don't mind admitting, I haven't a clue.

Working on the theory you don't have to be a mechanic to drive a car, I know where most files go and what to do if my Amiga crashes.

But when it comes to anything else it all goes right over my head. For instance: On the CD, there's a section that says 'Ben Speaks'. Until recently he didn't, well that is to say, not on my computer. What I used to get was a box that told me it couldn't create a CL\_String. This is probably because IBrowse couldn't find the MCC/Newstring.MCC...

In other words, how about a section entitled 'The complete and utter idiot's guide to the Amiga' incorporating: What files do; How to use them; Where to put them and where we can get/find them if we don't have them.

If you've read this far, many thanks.

RL Nettleton  
Surrey

*What a long letter! Okay, you've raised interesting points, so I will take them one by one, but please can everyone who wants to write in keep your letters more concise, asking only one or two points? It just keeps the mailbag page a little more lively.*

*Aaaaanyway, taking your points in order. I'm sorry you had a bad experience with Alive, but the coverdisk demo of Gilbert Goodmate was probably organised before the split with Crystal anyway. However, your complaint about their service is more serious and I hope that they don't treat all their customers this way and it was just a glitch.*

*Your next point about iBrowse is well taken (the Newstring.mcc file can be found in the iBrowse drawer. It needs to be put into your MUI:libs/mui/ drawer. It's easiest to do this with a file manager program, but there's too much to talk about here...). This month we're starting a complete beginners series of tutorials. You'll find the first one starting on page 60.*

## BACKSTAGE BLUES

Just a short note to say that I understand your decision to stop producing the subscriber floppy disk because you are trying to phase out the floppy disk version of Amiga Format (a good idea since almost everyone should by now have a CD-ROM drive).

However, I am disappointed that you have decided to stop printing Backstage (the subscriber newsletter). I have always thought that one of the benefits of being a subscriber (aside from the excellent discount and free delivery!) was reading your (or at one time Nick Veitch's) extended editorial/thought for the month. The loss of Backstage also means the loss of the subscriber exclusive competitions (another great benefit). Even if you have to get rid of the newsletter, then perhaps you could continue the subscriber competitions (sending each subscriber a membership number to be quoted when entering the competition to prevent cheating, perhaps). Maybe if Backstage was continued, subscribers like myself could contribute hardware tips, game hints, thoughts

etc. This might also encourage new and old subscribers.

On a different note, all this QNX/Linux changeover stuff is pretty worrying. Could you confirm that there will be the possibility of a QNX and Linux OS for the new Amiga, or is QNX now to be ported to PC/Mac, as I was a little confused by the statements in AF127 (Duh!).

Ross Whiteford  
Perthshire

Unfortunately, Backstage's presence, or lack of it, is all down to economics. We do want to give readers value for money and subscribers are a very important part of our readership, but while you say that the competitions are a bonus it's rare for us to get more than 100 entries, not many considering how many subscribers we do have. The QNX/Linux thing is confusing, but we hope to bring you all the news as and when we have it. Don't worry about it affecting the deadlines for the new machine. Amiga still plan to have the first ones out by Christmas...

# The Gallery

AFCD44:-ReaderStuff-/Gallery-

After last month's spectacular efforts, **Ben Vost** is more keen than ever to take a look at your artwork.

**CoastalInvasion.IFF, Downpour.IFF, HornetCloseup.IFF, NickySci-Fi.IFF, Porsche Industrial.IFF all by Greg Barrett**

Greg has been very busy tweaking the most from *Lightwave* in order to do these fine compositions. The lighting is pretty good, but the CG elements still look too clear and out of place. Greg, it may be worth your while trying the film grain plug-in, or composing afterwards using something like *ImageFX* to marry the two halves better. Otherwise, though, beautiful renders. We look forward to seeing a completely composited animation soon...

© Copyright 1999 All Rights Reserved Greg Barrett

**DeepDown2.Png by Andy Kinsella**

Andy's image is one he submitted for a compo on the *Imagine* mailing list and just proves the kind of quality you can get with that program if you're willing to stick at it. Even more impressive is the fact that there are no textures or brushmaps in the scene (although they were allowed outside it).

**Colin\_Baker by Colin Baker**

I'm sure this image probably isn't called that, but that's what Colin decided to name it when he sent it in to us, so... This picture is the design for a hospital radio station.

**HANDHELD.TIF, KYOTOPIC.JPG by Neil Corbett**

Neil did these models fairly swiftly after the first pictures were released, and we're pleased he sent them in to us. They are both created in *Cinema4D*, and Neil says he'll make Cinema objects of all the other sketches soon.

**Redsea.jpg by Gary Robinson**

Gary's little masterpiece is a real multimedia event. He grabbed the waves using *VLab Motion*, built the cars and buildings with *Imagine* and composited the whole lot in *ImageFX*, with added lightning.

**Beetle.iff by Kirsti McGregor**

A nice psychedelic VW from Kirsti who's only 14. The back end's a bit stretched but other than that, it's a nice colourful drawing.

**VERONA.JPG by Mark DeWolf**

A lovely surreal image that seems to blend 2D and 3D in a Paddington Bear kind of style. Shame Mark didn't include a readme for the CD so he could tell us how it was made. Even so, it's nice to see input from people outside of the UK - Mark's from Singapore.

**Destruction.JPG by Nick Rowe**

Nick's sent in a huge composition, but it doesn't hang together very well, looking like several disparate pictures slung together. Still it looks very nice when seen as a whole and Nick couldn't even view the finished picture on his own machine!

**CONTRIBUTIONS**

If you'd like to enter your work (and it should be only your work!) for the Gallery section on the CD and the pages in *Amiga Format*, read the Reader Submissions advice on the CD (you can find it in various places) or simply make use of the form from the CD pages of this magazine.

# Serious disk

**AMIGA  
FORMAT**

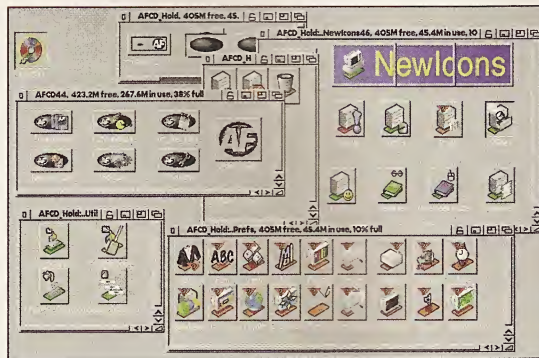

**Errol Madoo** brings you a groovy transparent clock, the complete **NewIcons 4.6** package, a menu driven means of rebooting your Amiga and if that wasn't enough we've thrown in even more!

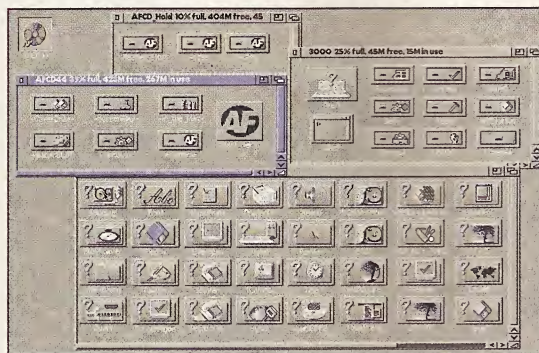

## NewIcons 4.6

Commodore's first step towards ReTargetable Graphics was seen with the release of Workbench 3. Although capable of displaying a 256 colour Workbench screen its icons were limited to only eight colours. Due to this limitation, Commodore's RTG system soon saw developers pursuing the ideal fix to the problem. One of the most famous of the alternative systems was the MagicWB icon set along with its resulting additions which, in a nutshell, used a palette of 8 custom colours and some sophisticated dithering techniques to produce icons with more perceived colours. The MagicWB icon set coupled with the GUI control system MUI are, in my opinion, what the Amiga is all about,

**NewIcons in all its glory. Do you prefer this over the standard WB or MagicWB icons?**

**Here's a similar screen showing you MagicWB icons. The choice is yours...**

**66** *The basic idea behind NewIcons is that a user shouldn't need a fixed colour scheme for icons.* **99**

giving it a distinctive look, feel and unrivalled configurability.

The other RTG icon system is NewIcons, which in its simplest form is a system patch, and in many ways this was and is the best system. The basic idea behind NewIcons is that a user shouldn't need a fixed colour scheme for icons. NewIcons will automatically remap icon images using the colours available on the Workbench screen. A specific palette is therefore not required but it is suggested to obtain best results. If you use a Workbench with more than 64 colours, you can ignore the palette completely. NewIcons solves most of the icon

problems found on MagicWB based systems, for example; it allows icons with upto 256 colours and it allows for palette independent icons making them appear correctly regardless of what default palette is used. It is, some would say, very

PC looking in appearance but I guess that NewIcons is an acquired taste, some people like it and some don't.

Installation is simple and if you have a previous version of NewIcons installed it will recognise this and just install the updated files. The full package requires 300k of free space on your hard drive. NewIcons comes with a complete replacement icon set for all the standard Workbench icons along with many additional icons and should you need more you can find many NewIcon collections on the Aminet or from your local PD library.

### REBOOTWB

**Ami-RebootWB** is a handy little commodity that quite simply adds a valuable RebootWB command into your Workbench's tools menu. You just double click on it's icon and take a sneaky peek in your Workbench's Tools menu where you will find a new option called, strangely enough "RebootWB". Selecting this option will bring up a little requester informing you that all your unsaved data and the data in RAM: will be lost if you continue and asking you if you would like to proceed. Clicking on "No" will cancel the requester and return you to Workbench and clicking "Yes" will obviously reboot your Amiga. You can even plonk the ReBootWB icon in your WBStartup drawer if you decide that you want to use it on a constant basis.

RebootWB - it does exactly what it says on the tin

# BackClock

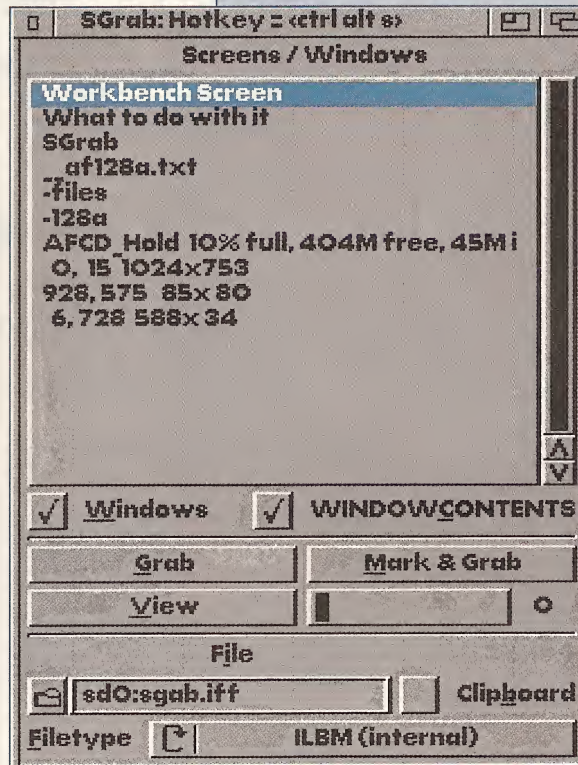

Workbench clocks are nothing new, there are probably hundreds available for your Amiga, each looking slightly different and perhaps featuring some unique extra feature. Personally I have never really bothered with a replacement WBClock. In fact, I have never really bothered with using a clock at all, simply because I find it easier to tilt my left forearm a little and look at my watch. If I were to be brutally honest, I guess that the truth of the matter is that I have never found a replacement clock that is cool enough to deserve a place on my workbench screen. That was until I came across BackClock, a great little replacement for the boring looking clock found in Workbench's Utilities drawer.

So, what made BackClock stand out from the crowd? The simple answer is its transparency. Yes folks! BackClock is totally transparent. It just sits on your Workbench screen doing its funky stuff, smug in the knowledge that it looks really cool. Featurewise, BackClock isn't very well endowed, it tells the time and that's about it. There's no date, no countdown to the millennium, no alarm, it doesn't even make the coffee

## SGRAB

If you have an Amiga with at least a 68020 processor running Workbench 3 or above and need to grab Workbench

SGrab allow you to grab most Workbench based screens and windows.

based screens or individual windows, SGrab is the utility for you. It allows you to save screens or windows as ILBM or JPEG files and supports all display

modes provided by Picasso96, CyberGFX and/or by the native Amiga chipsets. SGrab requires no weird libraries and its installation is simply a matter of copying the SGrab icon to your desired location (unless you want to install the foreign catalog files).

Once in place, double-clicking on the SGrab icon presents you with the main interface window containing all the controls needed for you to start grabbing. At the top of the interface window is a scrollable list containing all the workbench screens and windows that are currently available and at the bottom of the window are all the gadgets for the program's various options and settings. If you have the notifyintuition.library, by H.W.Schober, installed on your system (supplied with BackClock on this coverdisk) the list will be automatically updated each time a window/screen is opened or closed.

The main gadgets include "Grab" which initiates the grabbing process (after you have given your grab a filename) and "Mark & Grab" that pops the selected screen to the front and allows you to select the area that you want to grab. SGrab also gives you the ability to set up a time delay allowing you to set the desired screen up with all windows in the right position before the screen is grabbed. By default, SGrab allows you to save your grabbed images in IFF and Jpeg formats, but you will need to have the Jpeg datatype installed on your system in order to save in Jpeg format. SGrab also includes a whole host of additional features including clipboard viewing, datatype support and a fully featured Arexx port.

but, who cares? It just sits on your Workbench, in scalable, windowless and borderless bliss looking really really coool!

BackClock should run on any Amiga

If you are looking for a cool clock replacement, take a look at BackClock.

with OS 3.0 or above and requires that some standard libraries are available in your LIBS: directory. Two other libraries (notifyintuition.library and rtracker.library) are also required but don't worry, they are included in the archive

## WBBUMP

I recently featured an earlier version of WBBump on an Amiga Format Subscriber's disk and was so impressed with what it did that I thought that I would treat you guys to the latest version. Basically, WBBump is a tool that will make your Workbench screen the envy of your PC owning friends. Describing what WBBump does could be summed up as a classic case of a picture is worth a thousand words but in this case a moving picture is worth a lot more than a thousand.

Broadly speaking, WBBump puts any greyscale image or logo on your Workbench screen (or any screen of your choosing) and

converts it to a bumpmap. Your mouse pointer, although not physically changed in any way, is transformed into the bumpmap's light source and as you move your mouse pointer around the screen the light source is changed on your image producing the effect of movement. Although this sounds pretty boring (not helped by my explanation) it's really a case of trying it out to see for yourself.

Installation is pretty straight forward and just involves copying the main program directory to your hard drive, adding an assign to your user-startup file, putting one of the sample projects into your WBStartup drawer

and then rebooting, perhaps using RebootWB from this coverdisk.

WBBump needs Workbench 3 or above, a minimum of a 68020 processor and preferably a Cybergraphics card. It should work on an Amiga equipped with a Picasso card and this, the latest release also features AGA, ECS and OCS support so nobody should be left out. You should also make sure that your Workbench is running in backdrop mode (so doesn't have a window around it). As mentioned earlier, WBBump can be configured to run on any screen of your choosing and this, along with most of the program's configuration is done via the icon's tooltypes.

AMIGA AMIGA AMIGA AMIGA

It's a little hard to take a screenshot of an animation but this should give you a rough idea of what WBBump does.

# Games disk

**AMIGA  
FORMAT**

Errol Madoo presents this month's games disk which features the funky **AstroKid**, a battle against **Evil Insects** and a groovy **Tetris** variant called **Rockslide**.

## AstroKid

**A**strokid is an innovative and clever mix of several different gametypes, it's a sort of mix between the legendary *Space Harrier* and *Asteroids* with a few puzzles thrown in for good measure. It features some really groovy graphics, addictive gameplay and some funky in-game music scores.

In level one the aim is to destroy as many oncoming flying objects as possible using your cross-hairs. These objects include waves of comets,

66 *Astrokid features some really groovy graphics, addictive gameplay and funky in-game music* 99

asteroids, different alien ships and even *Star Wars* looking tie-fighters. On this level particular attention must be paid to objects flying directly towards you because if you are hit you lose energy which can obviously be replenished when you destroy them.

Level two is played on a static screen and your character has gained a space suit and jetpack (he has crash landed on planet Funk). He faces a huge green monster which dominates the right hand side of the screen. This monster obviously isn't very happy with you trying to destroy him and spends most of his time spitting energy balls at you which you need to avoid. When the monster is just about to die, he launches an alien creature at you from its stomach in a last ditch attempt to kill you. Defeat this creature and you will proceed to the next level.

A grid of thirty six squares greets you on level 3. The aim here is to find 12 matching symbol pairs contained

How on earth does he expect to make it through five levels with eyes like that? That's why he needs your help!

within the thirty six squares, this has to be completed against the clock. In level four, you have to negotiate through very fast sideward scrolling caves collecting stars on the way. You need to collect 10 stars in total, to repair your ship, and the scrolling continues until you have completed this task or die. Level five, the last level, sees you back at your ship and it's repair time. You are faced with a 5x5 grid of sliding squares and you must slide the squares around to complete the picture in order to repair your ship. Once done, you have completed the game. You can complete the game can't you?

*AstroKid* also features a options screen containing quite a good array of options including 10 difficulty settings, location of the onscreen scoreboard, toggles for background music and intermediate chapter

information screens and, would you believe, even a option to set the number of lives that you can start with. For some reason the game doesn't include any in-game sound effects just background music tunes. The game is completely controlled with the joystick and should work on all Amigas. Hard drive installation is a breeze and simply involves copying the complete *AstroKid* directory to the desired location on your drive, opening it's directory and double clicking on its icon.

EEK! It's coming straight at me. Shoot it!

Take that you horrid green beastly, you. And don't even think about releasing stomach-dwelling aliens at me. I'm too hard for that.

# Evil Insects

The story starts sometime in the near future when a small Asian country starts testing their nuclear weapons. Due to strong winds, the nuclear fall-out was spread over large parts of the world. The effect on human life was minimal, but the insect world saw the brunt of the fall-out and insects started mutating into killer EVIL INSECTS with only one thing in mind: the destruction of human life. Humans were advised to stay indoors and the armies of the world were almost powerless to stop the spread of the mutant insects. Neither conventional or nuclear weapons were of any use in mankind's struggle to destroy the insects.

While all human life was facing its untimely demise, you discover an ancient Greek book which contains the story of the Evil Insects' invasion of ancient Greece. How could this be? There were no nuclear weapons in ancient Greece. How did it start? As you flip through the pages of the dusty book, the story of the last invasion of the Evil Insects unfolds. It had all started with a spell from an evil Magician, who was intent on killing all human life. Realising that he had made a grave error and that a solitary life on earth wasn't for him, he cast another spell to put an end to the invasion. But things didn't go as he expected, he had used all his power casting his original evil spell. What was he to do? In sheer desperation, and having no other option, he looked to the heavens and prayed to the gods for help. A bolt of lightning shot from the skies towards him... there was a puff of smoke... and a thundering voice bellowed... "Read the flippin' manual!". The magician looked down and in the smoking remains of his cauldron was a manual. It revealed that the only way to destroy the Evil Insects was to build a temple at a specific location. The ceiling of the temple was to be made from layers of magic stones. If such a magic stone would fall on an insect, the insect would be instantly destroyed.

Killing insects with magic rocks is nearly as much fun as using a magnifying glass on a hot day.

## ROCKSLIDE

*Tetris* has become a huge success in the computer gaming world. Needing an almost unique combination of quick reflexes and thinking, players can quickly become addicted to the game in a constant struggle to get a little bit further in the game. There have been many *Tetris* variants and *Rockslide* is one of these seemingly endless spin-offs. In "original" *Tetris* game the player must arrange (rotate) coloured pieces into lines as they appear on the screen and float towards the opposite side. Once a line has been completed, it drops off the screen and the saga continues. The object of the game is to complete as many lines as possible. Although this sounds relatively easy and perhaps even boring, it's surprising how addictive (and frustrating) *Tetris* actually is.

There's plenty of *Tetris*-style fun and frustration to be had in *Rockslide*.

In *Rockslide* the *Tetris*-style shaped colour pieces have been replaced with with stacks of 3 coloured spheres (rocks) which gently fall down the screen. The object of the game is to create lines, either horizontal or vertical, of three of the same coloured rocks. This is accomplished by a combination of left and right movement and rotating the sequence of coloured rocks as they fall down the screen. When you have created a line of three of the same colour, the three matching rocks vanish, you get some points, and all the rocks above the removed rocks drop into their place. This sequence of events continues until you have either

filled up the play area, given up or pulled all your hair out.

The left, right and down movements of the descending rocks, is controlled with the keyboard using either the cursor keys or arrow keys on the numeric keypad and the colour sequence of the rocks is cycled using the spacebar. The only other keyboard key used is the "P" key with pauses the game. The left hand side of the screen also features buttons for starting a new game, quitting, toggling the music and sound effects and the help screen. *Rockslide* should work on all Amigas.

As you flip to the last pages of the book, you find a secret map of where the temple was located and a description of how to build a device to lure the insects to the temple. Armed with your self-made gun, the map and the device you try to find your way to the temple. As you arrive, you turn on the device and you wait for the insects to appear. Your task is clear, you must rid the world of the EVIL INSECTS... your task begins...

The objective of the game is to kill the Evil Insects using your gun. You control the main character with the joystick in port 1. You can move the joystick LEFT and RIGHT to run. To shoot your gun you press FIRE. You cannot shoot the insects directly, you have to shoot at the ceiling, which in turn causes a magic stone to fall, hopefully killing an insect. This is a little tricky at first, but you'll soon get the hang of it. Then comes a twist. You can only shoot when there is no magic stone on the screen. This means that if you just fired your gun, you'll have to wait until the magic stone disappears from the screen before you can fire again. Then comes another twist. A magic stone will only fall from the ceiling if you aimed at the

ceiling in the first place.

Every level contains dangerous insects that drop projectiles. When you are hit by these projectiles you lose a life. Each of these projectiles will have its own randomly determined speed, so watch out. In the later levels, the insects will move faster and drop more projectiles. When one of your magic stones hits an enemy, the enemy dies. You will be awarded some points depending on what the enemy looked like. Sometimes a dead insect drops a power-up which are worth points as well as as giving extra functions. The white one awards you with an extra life, a green one gives you extra speed and a blue one makes the stones fall faster. Each time you die, you will lose a life, but you will also lose any extra speed you had. When the game is over or you have completed the game, and if your score is good enough, you will be given a place in the highscore table. During the game you can use the "Esc" key to return to the intro screen, where you can press "Esc" again to return to Workbench and the "p" key to pause the game. The game has 50 levels and should work on all AGA Amigas

## DISK NOT WORKING?

We take every care to test the coverdisk software, but Future Publishing cannot accept any responsibility for any damage occurring during its use. If your disk is faulty, send it back, with 2x26p stamps and an SAE to:

AMIGA FORMAT (insert name of disk) • TIB PLC • UNIT 5 • TRIANGLE BUSINESS PARK • PENTREBACH • MERTHYR TYDFIL • CF48 4YB

If there is a manufacturing error then the stamps will be returned with a replacement disk.

# Cover disc

## AMIGA FORMAT

How do we do it? Yet another CD crammed full of software. **Richard Drummond** is your guide.

### IMPERATOR

**-ScreenPlay-/Commercial/IMPERATOR\_DUK**

*Imperator* is a strategy war game set in imperial Rome. It was released earlier this year in French only, but has now made the jump across the Channel with an English translation. The game is divided into two parts: the first part casts you in the role of Caesar with the task of ensuring the prosperity of the Empire; in the other you play a general and must guide your troops in battle.

This demo features only the battle section of *Imperator*. You may select to be one of a list of commanders (most of whom have rather Pythonesque names), the type of Legion you wish to lead and the terrain for engagement. Your troops may be made up of different units including infantry, archers and cavalry. You may even be equipped with catapults – a great tool for routing those barbarian hordes. The game is turn-based: you simply issue orders to your troops, click accept and watch them go.

*Imperator* looks great and is loads of fun. Look forward to a full review next issue.

He has a wife, you know. Incontentia Buttox...

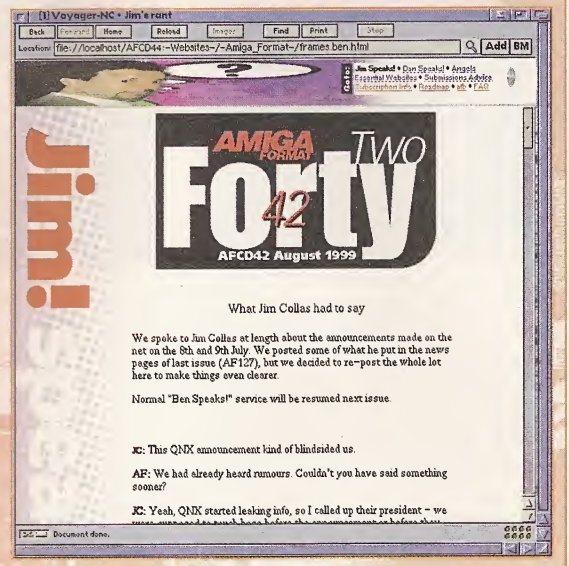

### WHAT'S NEW

Ben and I have been usurped in the HTML section of this issue's CD. Not that we mind. We've decided to use this space to print the full interviews that Ben conducted with Jim Collas and Dan Dodge last month (which we could not cram into the news section). Read it all and make up your own mind about just who is building the true successor to the current Amiga. Our normal service will be resuming next issue.

Other changes this issue include an update to *AFCDFind* especially for users of Scalos, the *Workbench* replacement. Any drawers which result from an *AFCDFind* query may be opened directly on your Scalos desktop simply by clicking the result with the your mouse.

Oh, and by the way, we know that the *AFCD* logo on the HTML pages is actually for the wrong CD number, so please don't bother writing in to tell us. We spotted it only just to late to do anything about it.

Full interviews with Messrs. Collas and Dodge.

### PPAINT 7.1B UPDATE

**-Serious-/Commercial/PPaint7\_Update**

**-Serious-/Commercial/PP71B\_68020**

*PPaint* is a program that should need no introduction: it is the king of bitmapped paint packages. This is an update for owners of the full release of either *PPaint7.0* or *7.1* and mainly fixes some bugs that occurs when using it with the chunky screenmodes of a graphics card. Also included is a 68020-

optimized version of the main *PPaint* executable which should provide better performance on machines equipped with an 020 or better.

### GOLDED6

**-Serious-/Commercial/GoldEd\_Demo**

A good text editor is a must for anyone that uses a computer seriously, whether it's for knocking together source code, writing e-mail, or just plain word-bashing. The Amiga is shipped with two editors, *Ed* and *MicroEmacs* – but both these have seen better days. So, what's the alternative?

Well, you could get a copy of *GoldED*. *GoldED* started off life as shareware but is now, quite deservedly, a

Pixel prowess with the latest update to *PPaint*.

# Your Stuff!

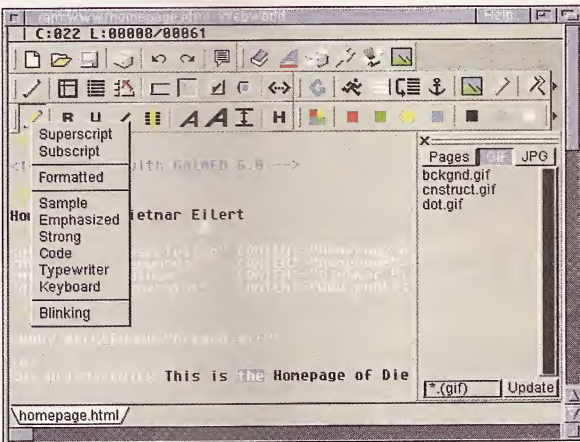

For the last few issues we have been receiving a steady stream of your contributions. Alas, not so for this issue. Whether it's because of the summer weather or just plain laziness, but readers' contributions for this coverdisc are decidedly thin on the ground. Nerver mind. It's quality not quantity, after all.

Speaking of quality, this month's winner of fifty notes for the best entry is Richard Sweeney. Richard has sent us his game *Tanx Squadron*, a turn-based strategy game in the mould of *Laser Squad*. The objective of the game is control your ten vehicles and destroy the alien invasion force currently attacking the earth. *Tanx* is an accomplished, well-produced game and Richard more than merits this issue's prize. Well done that man!

**Tanx Squadron: this issue's winner of the coveted AF reader prize.**

commercial product: it is an incredibly powerful text processor. Its graphical interface takes a bit of getting used to and looks too much like Windows for comfort, but for speed and features it can't be beaten.

**GoldED3's WebWorld add-on in action.**

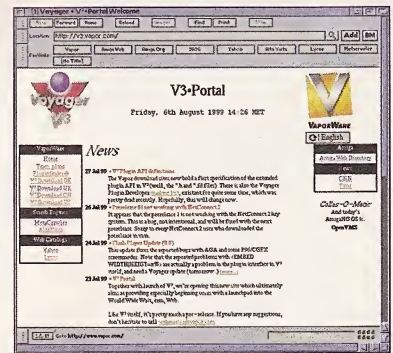

One of the great aspects of *GoldED* is its configurability. It even has a built-in filetyping mechanism. This allows you to simultaneously have different settings for each type of file opened. *GoldED* is shipped with add-ons which make use of this feature and provide environments tailored for specific tasks, such as editing C source code or creating web pages. Other add-ons include a spell-checker and thesaurus and a *MineSweeper* game. This demo version of *GoldED* is restricted and will not allow the saving or printing of documents.

**VOYAGER 3 PREVIEW**  
-Serious-/Comms/WWW/Voyager-30-PR1  
This is the first preview of the new *Voyager*<sup>3</sup> and was the release that was being demoed at the recent World of Amiga show. Improvements from the previous version of *Voyager* are too numerous to list, but the two features that everybody will be interested in are

the JavaScript support and the ShockWave plug-in. Other interesting advances include *Netscape*-like tear-off button strips and integration of *Vapor*'s new *Contact Manager* for bookmarking.

Another new addition with *Voyager*<sup>3</sup> is the opening of the *V3* Portal website. This is a bit empty at the moment, consisting only of news about *V3* updates, but one amusing feature, tucked away in the corner of the page, is the *Collas-O-Matic*. It reads 'And today's AmigaNG OS is:' and prints a name of a different operating system every time you download the page. Nice touch!

A keyfile from a registered copy of *Voyager* is required for this preview to work. It was also supposed to function with the keyfile from the *NetConnect2* package but, in fact, does not. A new preview will be available shortly for *NC2* users.

**The new V3 portal site. And today's AmigaNG OS is CP/M...**

It must be remembered that this is still only a preview and is quite likely to have bugs and stability issues. For more information read the *Browsers Preview* article on pages 44-45.

**Continued overleaf →**

## VIRUS CHECKER II 2.1

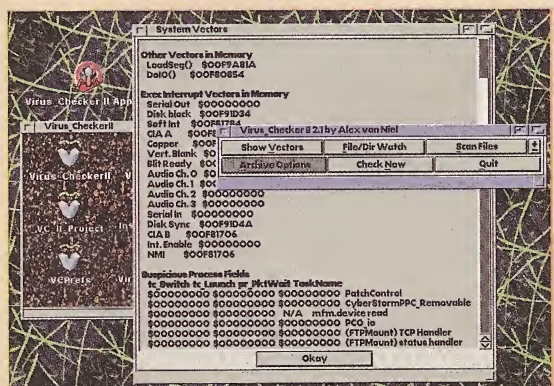

-Serious-/Virus/Virus CheckerII

Amiga users tend to be rather complacent about Viruses these days. When the rest of the world was suffering from Melissa we looked on smugly, safe in the knowledge that it could not harm us. But rogue programs are still being created on our platform as the recent spate of Trojan Horses uploaded to the Aminet proves. Okay, these were relatively benign, simply bombarding an Amiga, Inc. mailbox with abusive emails, but we should bear in mind that viruses can be destructively disruptive.

A good and up-to-date anti-virus program is a vital tool for keeping your machine free from infection. *Virus Checker II* is just such a tool. When started up it interrogates the memory and system vectors for anything that looks suspect and it can examine the bootblocks of any floppy disks that you insert. It can also scan any files you tell it to, even inside crunched files and archives, and can watch specific files and warn you if any task tries to tinker with them.

To get full protection make sure you register *Virus Checker* and remember that no anti-virus program is fool-proof.

**VCII: it kills all known viruses dead.**

## AUDIO TRACKS

As well as all this fantastic software, we've managed to shoehorn two CD audio tracks onto this month's coverdisc. The first of these is from a man you all know, Tony Horgan, and ties in with his Synth Studies tutorial in this issue. The other track is from the game Operation: Counterstrike which is currently being developed by BLUE BLACK Solution. This game is set to be another Command & Conquer clone.

Operation: Counterstrike is looking good.

## NEWSROG 1.7B

-Serious-/Commercial/NewsRog\_Demo

The Internet is a jungle, Usenet especially so. To survive on the newgroups you need to be packing the right equipment: *NewsRog*.

*NewsRog* is quite simply the most powerful news client on the Amiga or any other platform. It boasts more features than I can do justice to in the available space and yet has a clear and usable interface. One of its best features is its multi-threaded design which allows you to carry on reading and replying to posts even when the program is performing transfers to a server. *NewsRog* also has powerful MIME support and can display images inline in up to 24-bit on supported screens.

The supplied demo of *NewsRog* is restricted and will only allow you to subscribe to two groups. It will also not permit the saving of preferences.

## YAM 2.0

-Serious-/Comms/Other/YAM2.0

After seven preview releases there is at last a full release of *YAM2.0*, the Amiga's most popular e-mail client. All previous *YAM2.0* versions were essentially public beta versions, but this has not stopped it developing a devoted

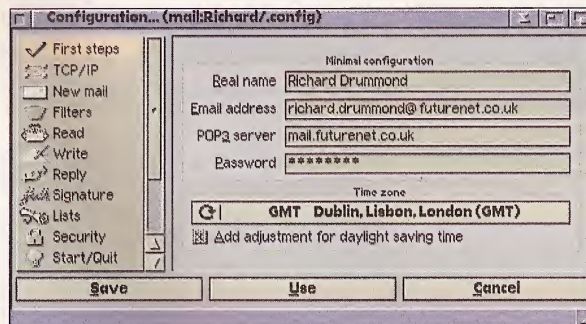

*NewsRog* might be a silly name, but it's a very serious package.

following. Despite its beta status, later previews proved very reliable, overcoming its earlier reputation for flakiness.

Users who have been progressing through the beta releases of *YAM2.0* may in fact be disappointed with the final – it doesn't look or behave much differently. And many of the features that users have been asking for have still not been introduced. On the bright side, this is the first time binaries optimized for higher 68k series CPUs have been shipped with the *YAM* distribution.

Love it or hate it, *YAM* remains one of the most powerful and yet easy to use mailers for the Amiga.

Not that you'd notice, but this is the final release of *YAM2.0*.

## DISCLAIMER

This *AFCD* has been thoroughly scanned and tested at all stages of production. We recommend that you always run a virus checker on ANY software before running it. Future Publishing Limited cannot accept any responsibility for disruption, damage and/or loss to your data or your computer system which may occur while using this disc, the programs or the data on it. Ensure that you have up-to-date backups of data contained on your hard drives before running any new software. If you do not accept these conditions, do not use this disc.

## DISC NOT WORKING?

If your *AFCD* is defective, please return it to the address below. Please make sure you have followed our installation procedures correctly to ensure that there is no physical problem. Please send us the *AFCD* along with a description of the fault (not forgetting your name and address). A new working version should be returned to you within 28 days. The return address for faulty discs is:

TIB PLC • UNIT 5 • TRIANGLE  
BUSINESS PARK • PENTREBACH •  
MERTHYR TYDFIL • CF48 4YB

Your *AFCD* should only need replacing if the CD itself cannot be read. If you're experiencing problems with an individual application, phone our technical support line.

This is open between the hours of 2pm and 5pm every Tuesday.

Tel: 01225 442244 Fax: 01225 732341  
Email: [amformat@futurenet.co.uk](mailto:amformat@futurenet.co.uk)  
(Please remember to put "Coverdisc" in the subject line.)

Please note that the helpline staff provide assistance with technical problems directly related to the CD and cannot provide training on the software or hardware in general.

# We want your work!

You can either send it to us on floppies, Zip disks or CDs (we do take other media formats too). If you are going to send us a multiple floppy backup of your work, please use the version of *ABackup* we supply on the CD in the +System+Tools/Disk\_Tools drawer. We'll return any Zips you send us, so don't worry about getting your disks back.

If you have any further queries about how to send your software in then consult the Submissions Advice on the CD (in Ben\_Speaks!, or in the ReaderStuff or +System+Info drawers).

Your signature: .....

Files you send in this month will probably appear on *AFCD46 - Amiga Format* issue 130, December.

## Please tell us:

# at the WoA

Chris Livermore reports on how much user groups contributed to WoA.

This year's World of Amiga show saw a departure from many of the traditions associated with the show, such as the old venue, and the introduction of a whole host of new ideas aimed at improving the show for exhibitors and visitors alike. One of these new features was offering Amiga usergroups a free stand at the show to promote themselves. In my opinion this proved to be wonderfully successful. Approximately ten usergroups took stands at this year's show, including two from overseas. In addition, two giant maps of the UK were provided, highlighting exactly where each usergroup is within the UK, and offering those usergroups who were unable to attend the show a chance to still get their name across to the Amiga-owning public.

### UNIQUE OFFERINGS

Each usergroup managed to bring something slightly different and unique to the show. Most had brought Amigas with them and were running various software, old and new, and many had

experts in a particular field of Amiga use on hand to offer help and advice. Seal and Kickstart were selling their excellent Amiga magazines, *Clubbed* and *Amiga Insight* respectively, LAUG (Leicester Area Amiga Group) were demonstrating the latest version of *Photogenics 4* on their stand, and Waaslandia from Belgium, BTX from Germany and the UGN (User Group Network) had the obligatory Webcams and IRC conferences broadcasting live throughout the entire show.

Originally, the lower ground floor had been set aside for usergroups. However, due to the high demand, some usergroups were accommodated on the first floor. This arrangement worked very well, as neither location was more than 10 metres from a bar so everyone was happy!

As well as exhibiting at the show, a number of the usergroups got involved in organising extra events associated

and a copy of *T-Zer0* for the best score each day. A Cybercafé failed to get online due to hardware problems, which is a real shame given the sheer amount of time and hardware put into it.

One of the real usergroup triumphs which probably went unnoticed by most show-goers was a loan of approximately 20 Monitors and two 43" back projection TVs from Sony UK, arranged by Mark Spearing from SWAG. He even arranged for them to be shipped to the venue from Wales! The monitors were used throughout the show by usergroups and exhibitors alike, and even Amiga themselves asked to borrow a couple of them.

### A GREAT SUCCESS

Every usergroup I spoke to thoroughly enjoyed the show and thought it had been a great success. They even remembered the whole point of being there and signed up new members! Both usergroup areas remained busy all the time the show was open, so it appears their presence was welcomed by the public as well.

Finally, I'd like to address a concern some people raised when the usergroups first got involved with this year's WoA: that it would lead to the

Two giant maps of the UK were provided, highlighting exactly where each usergroup is within the UK

Here's the Waaslandia stand. They came all the way from Belgium, you know. That's dedication.

with the show. Geoff Milnes and the guys from the Huddersfield

Amiga Users group spent most of their show behind the "How-To" stand demonstrating how to turn a vanilla A1200 into a state-of-the-art beast of a tower. SWAG (South West Amiga Group) arranged an "Amiga through the Ages" display, featuring almost every machine from the A1000 up. We tried, unsuccessfully, to convince Petro to bring a Walker, although apparently it will be on display in a similar exhibition in Cologne later this year. The show programme was left in the capable hands of SEAL (South East Essex Link), but due to a problem with the printers it never quite made it in time for the show.

Other usergroups organised activities including a Games area running a special WoA version of *T-Zer0* with literally hundreds of prizes of *Quake* books given away throughout the show,

show having a unprofessional feel to it. I hope that everyone who attended this year's show will agree that that concern was completely unfounded. Usergroups are an important part of the Amiga scene, and as such I believe that they should be given a chance to represent themselves at Amiga events such as WoA. I also believe that their involvement made it possible to offer facilities at this year's WoA that were not present at previous shows. For example this was the first year that the organisers were able to offer a secure internet ticket ordering system, which was, of course, provided by a usergroup.

I can't wait until next year's WoA. Hopefully Amiga will have some great new machines by then, and hopefully the usergroups will help to make next year's show a fantastic event.

## Lost Souls Form

No user group near you? Then fill in this form and send it to: User Groups • c/o Amiga Format • 30 Monmouth Street • Bath • BA1 2BW.

Postcode\* .....

\*You must fill in your postcode as this is used to calculate how far from other Lost Souls you are.

Amiga Format's mailing list is getting more active all the time. Over 700 people are now on it. **Why aren't you?**

**T**his issue's foray into the world of the Internet mailing list for *Amiga Format* brings the shocking news that people really aren't all that keen on the cinema. They prefer to keep their complexions sallow by staying indoors looking at a small screen, instead of going out and staying indoors looking at a large screen, with some people not having been to the flicks since *The Jazz Singer*, starring Al Jolson!

In addition to such frivolity, there has been discussion of what TLAs, abbreviations and acronyms stand for in the computing world, how to improve your connection speed online and lots of talk about fibre channel devices and the moon landings.

Because of someone complaining in these very pages (see Mailbag), I now

put it to you that to get the most from the delights of afb, you'll need to accept the cookies that eGroups sends out, but other than that the service seems to be running fairly well.

Remember that you don't actually have to use the afb website at all, limiting your exposure to the little digital biscuits, but if you don't then you can't make use of the many additional features like the calendar, opinion polls, reviews databases and much more that's available on the website.

The amount of messages daily has settled to no more than 150, with many offering information not available anywhere else in the Amiga market, so to get the latest technical info and support from the many bright people on the list, sign up to the afb now.

## GETTING ON AFB:

You can subscribe to the afb by going to the following website and signing up:

<http://www.egroups.com/group/afb/>

If you just want news on when the next issue of *Amiga Format* will be out, we offer that at:

<http://www.egroups.com/group/afb-announce/>

It's worth joining both lists since they each offer unique things and the announce list usually only has one email every four weeks.

**T**he fax-back service is growing this issue, but we still want to know what you want to see here.

Whether it's tutorials, reviews or features from recent issues or older ones, we're ready to include what you want to see, so just get in touch and give us the details of what you want (feature name, issue number, page numbers) and we'll put it on the list.

## HOW TO GET IT:

1. Dial 0906 302 1437 and wait for a fax check.
2. Key in the three-digit code listed in the table on the right for your chosen article.
3. Press Start/Send to receive your fax-back.

If you run into any difficulties, contact our fax-back helpline on 0870 120 1240 (helpline open Monday to Friday, 10am-5pm; calls from the UK are charged at local rate).

Fax-back calls cost 50p per minute at all times. The service takes between two and eight minutes per page, depending on the quality of the phone line, your fax machine's specifications and the number of photographs on a page. Introductory pages with illustrations only won't be included, only pages with text. UK premium rate numbers may not be accessible from overseas.

If you have a feature idea, a long term test, a reader request or you want to be in the Amiga Angels list, send an email to [ben.vost@futurenet.co.uk](mailto:ben.vost@futurenet.co.uk), with "Features", "Reader Review", "Reader Request" or "Amiga Angels" in the subject line accordingly. If you don't have email, a letter to the AF address with the same subject headings is also fine.

If you want to speak to us about a technical problem, we have a reader call day on Tuesdays. Call us on (01225) 442244 (10am-1pm, 2pm-5pm only). We're sorry, but we can't give games tips over the phone.

### YOUR GUARANTEE OF VALUE

This magazine comes from Future Publishing, a company founded just ten years ago but now selling more computer magazines than any other in Britain. We offer:

**BETTER ADVICE:** Our titles are packed with tips, suggestions and explanatory features, written by the very best in the business.

**STRONGER REVIEWS:** We have a cast-iron policy of editorial independence and our reviews give clear buying advice.

**CLEARER DESIGN:** You need solid information fast. So our designers highlight key elements by using charts, diagrams, summary boxes, and so on...

**GREATER RELEVANCE:** At Future, editors operate under two golden rules:

- Understand your readers' needs.
- Then satisfy them.

**MORE READER INTERACTION:** We draw on readers' contributions, resulting in the liveliest letters pages and the best reader tips. Buying one of our magazines is like joining an international user group.

**BETTER VALUE FOR MONEY.**  
 More pages, better quality  
 – magazines you can trust.

All contributions submitted to *Amiga Format* are accepted on the basis of a non-exclusive worldwide license to publish or license others to do so unless otherwise agreed in advance in writing. © Future Publishing Limited 1999.

**new product**  
£34.95

## new powermovie software

Power Computing is proud to announce the final release of its long awaited PowerMovie. After its successful review in the May issue of Amiga Format, PowerMovie, the animation editing tool, playmovie and the animation player tool, have undergone a few more changes and extra testing. Below is a list of the key features:

- Full compatibility with all AGA Amigas
- Edit 320 x 200, 256 colours or HAM-8 frames based animations
- Real time playback, including synchronised soundtrack and sound effects
- Frames can be any size and have different palettes (they will be resized and remapped according to the chosen format)
- Frames can all be played at the same (full) speed, or groups of frames/single frames can be played with a specified delay
- 17 frames per second should be possible on an Amiga with a 50MHz 68030 and 8MB of RAM. 25fps (and more) on a 68040/68060 equipped machine.
- Independent player to record on a VCR, show or view the animation
- A stereo soundtrack can be encoded with the animation
- Separate sound effects can be synchronised to specific frames
- Minimum requirement for decent playback speed is a 6x CD-ROM, 8MB of RAM and 68020 equipped machine

PowerMovie CD-ROM £34.95 plus p&p Business Licence £TBA

Power Computing is now the sole distributor for the UK of the Phase 5 product range. Check out our web site for all the latest product news - [www.powerc.com](http://www.powerc.com)

**blizzard 1240 desktop and tower**

Accelerator card for the Amiga 1200 - 68040 40MHz with MMU/FPU, up to 128MB RAM, optional SCSI 2 controller. Available for Desktop or Tower Amiga.

Blizzard 1240D 40MHz Desktop **£159.95**

Blizzard 1240T 40MHz Tower **£149.95**

**blizzard 1260 turbo**

Accelerator card for the Amiga 1200 Tower 68060 50MHz CPU with MMU/FPU, up to 128MB RAM, optional SCSI 2 controller, battery backed clock

Blizzard 1260 50MHz MMU & FPU **£299.95**

**SCSI-kit IV**

Fast SCSI 2 DMA controller for the 1230/40 and 1260 turbo board. The SCSI kit is a fast SCSI 2 DMA controller which allows the instant access to large variety of SCSI-1 and SCSI-2 devices. It's 32-bit DMA engine transfers up to 10MB/sec with up to 80% free CPU time. A second SIMM socket allows the memory to be expanded by 128MB. Comes with comprehensive software

**£69.95**

**new typhoon accelerator cards**

Typhoon Lite 2 68030 40MHz upto 64MB RAM **£69.95**

Typhoon SCSI Mk2 - full 68030 40MHz with MMU, optional 50MHz PGA FPU, upto 64Mb RAM, battery backed clock, includes SCSI controller, suitable for all tower systems **£89.95**

SCSI Adaptor for MK1 and 2 Typhoon **£19.95**

Viper MK2 68030 40MHz upto 32MB RAM **£55.95**

**blizzard 2040/2060 turbo**

Accelerator card for the Amiga 2000 68040 or 68060 50MHz CPU with MMU/FPU, up to 128MB RAM, on-board 50 pin connector fast SCSI-2 interface, full genlock compatibility.

Blizzard 2040 40MHz MMU & FPU **£269.95**

Blizzard 2060 50MHz MMU & FPU **£369.95**

**cyberstorm mkIII turbo**

Accelerator card for the Amiga 3000 T & 4000 T 68040 40MHz or 68060 50MHz CPU with MMU/FPU, up to 128MB RAM, ultra wide SCSI 3 interface slot for Cybervision PPC GFX card, full genlock compatibility

CyberStorm MkIII 040 40MHz MMU & FPU **£359.95**

CyberStorm MkIII 060 50MHz MMU & FPU **£469.95**

**amiga 500 accelerator card**

Viper 520CD, 68020EC 33MHz, without MMU, optional 33MHz PGA FPU, space for one 2.5"HD, support for up to four IDE/ATAPI devices, 8MB of Fast RAM on board and 3.0

Kickstart ROM including full 3.0 Workbench disk set FAT Agnus slot to fit Mini Mega Chip **£99.95**

Mini Mega Chip (2MB Agnus chip and 1MB extra Chip RAM) **£79.95**

**new hi-res 3d graphic cards**

CyberVision 64/3D (see our web site) **£169.95**

Picasso IV with ingrated flicker fixer **£249.95**

Picasso Modules - TV-Tuner, Live Capture, Pabloll - video encoder, MPEG decoder and Sound module. Call or see out web site for more details **£POA**

**memory modules and fpu's**

for accelerator and expansion boards

- 4MB SIMM **£14.95**
- 8MB SIMM **£19.95**
- 16MB SIMM **£29.95**
- 32MB SIMM **£49.95**
- 32MB SIMM (slim for Blizzard 1260 boards) **£79.95**
- 64MB SIMM (Typhoon and all Blizzards) **£139.95**
- 128MB SIMM (Typhoon and all Blizzards) **£199.95**
- 1MB ZIP RAM static column for A3000 **£16.95**
- GVP custom 4MB RAM module **£49.95**
- GVP custom 16MB RAM module **£99.95**
- 20MHz PLCC FPU **£10.00**
- 33MHz PLCC FPU **£15.00**
- 40MHz PGA FPU **£20.00**
- 50MHz PGA FPU **£29.95**

**memory expansion UPGRADES**

- A1208 bare with standard SIMM socket (upto 8MB) **£29.95**
- with battery backed-up clock (A1200) **£29.95**
- A1208 with 4MB SIMM + clock **£35.95**
- A1208 with 8MB SIMM + clock **£39.95**
- PGA 40MHz FPU for all the above cards **£15.95**
- A500+ 1MB Chip RAM battery backed-up clock **£19.95**
- A600 1MB Chip RAM battery backed-up clock **£24.95**
- A500 2MB RAM with battery backed-up clock **£49.95**
- CDTV 2MB RAM **£49.95**

**typhoon accelerator card**

Call Now For A Chance To

# WIN THE NEW AMIGA

AMIGA

# 09065 531 900

Win One of the Very First Amiga's off the Production Line!

Call Now for a Chance to Win the New Amiga!

Calls are charged at £1 per minute. Call should last around 3 minutes. Entrants must be over the age of 16 and residence of the UK to enter. Ask permission from the bill payer before calling. Enter as many times as you like. It's easy, just answer one simple question. A winner will be picked from a hat of correct entries. For rules or winners names send a SAE to Epic (MCC Competition), Area50, Cheney Manor Trading Est, Swindon, Wilts. SN2 2PJ. All details are correct at time of publication. Competition closes on the day the new AmigaMCC is released (Approx. February 2000).
